I choose my words to convey meanings, Ed, but your sentence
doesn't answer my question.

>> Or does it mean that the "livewire" at CW is so pumped up they are
>> prescient on guessing the "correct meaning" of garbled characters?
>
>C-N Y__ GU_S_ TH_ ME__NIN_ O_ T__S?

That might be "CCNY GUS THE MINNESOTAN" for all I know.
Could be a student or instructor from the upper midwest? :-)

Ed, as I said before, I broke into long-distance HF communications
with a rather severe requirement to be accurate. If a military radio
circuit was doubtful of some message data, the circuit handlers
would ask for a re-send. With TTY tape, that wasn't difficult at
60 WPM...the original and a re-send could be done faster than
two skilled morse ops doing 20 WPM high on caffeine.

When nuclear warfare is threatening during a Cold War, do you
think that the US military is going to entrust vital communications
to manual morse code?!? Why would anyone bother with
trying to guess message content under such conditions?!?

Ok, so I'm using my early adult experiences. Military
communications isn't amateur radio communications, but is
amateur communications requiring guessing of morse
characters?

Is guessing necessary in all those ham traffic networks
using only morse? Several long-timers have made much
of those nets and their vital information on health and
welfare. Seems to me that message content should have
accuracy in content. Maybe I'm wrong but I thought that
someone's health and welfare depends on accuracy, not

guesses.

>> upon thousands of others.
>
>Thousands of thousands? Seems a bit high to me. :-)

There's no polls available to verify all those who've expressed
an interest in amateur radio but were turned away by the
code test requirement. That might explain the quarter million
no-code-test Technicians that joined the US amateur ranks
in the last decade...even though so many long-time amateurs
openly hate and despise Techs.

"Thousands upon thousands" is a carefully chosen term I
wrote, not "thousands of thousands." My careful choice can
be interpreted as either several thousand, a whole million, or
some number in between. Your choice. Can you prove me
wrong on something that hasn't been quantified?

Of course they do, Ed the First. The "Publish or Perish"
syndrome is as alive and well today as well as a decade
ago.

Do you REALLY think that a full explanation of the program
along with flow charts would be "acceptible" to a member-
ship that prizes manual code skill over nearly anything else
in amateur radio?!? I don't think so based on input from
others concerning their expertise and "necessity" of manual
code skill...'others' include those not in this newsgroup.

>> Of course you did. Uh huh. Guessing at what garbled characters
>> "really meant." Hmmm...that sounds suspiciously like the Carroll
>> Syndrome at work. :-)
>
>It worked for me, Len. If you choose not to believe it, I see no harm.

I choose to not believe it. Of course, my break-in to real-world
communications was rather severe in accuracy on message
content (the USSR had the Bomb and was waving that around).

Fortunately the US military was using teleprinters back then,
not morse operators at each end.

>> Whoa. How did all this "guesstimation" become part of the Lore
>> of CW? [see "Accuracy Transcends Speed" or something like
>> that from another organization]
>
>I don't think the guesstimate is related to CW skills in any way at all,
>Len. Just happens that the thread is about CW copying by software.

Oh? Accuracy isn't required with manual morse code?

Are skilled human operators so good they can "fill in blanks"
due to garble and sloppy sending? I guess so.

>> Maybe I underestimated the Lore of CW. Maybe it is a large
>> detective game, of trying to find clues and other little details to
>> lead to some kind of conclusion? I find it fascinating to watch

>In what way do you think my statement that AI will someday advance to being
>able to perform a skill that right now can only be performed by a human to
>be CW lore or shorign up a ship?

I didn't send my message in private, Ed the First. This is in public
and all those other CW expert superoperators expound on the
Lore of CW, etc.

>> All I did was report on something I saw and heard working some
>> while ago. I make no claims to its efficacy other than it worked
>> at "human rates" and at rates faster than most humans can
>> tolerate. It had its drawbacks and was not perfected. So what?
>
>I think it was neat, Len -- neat enough that I was hoping he would share it
>so we could all learn a bit more about how to solve such problems.

Again I ask why? All those extrasuperior morsemen out there all
say that the only "problem" is practice, practice, practice so that
all newcomers can approach (but never equal) their superior skill.
That makes newcomers "acceptible to the amateur community"
or something like that.

I have no quarrel with you, Ed. I've never had any quarrel with
several other Ed persons I've met...including Ed Dodds, my
boss at Ramo Wooldridge in 1960 (forgot his W6 call). I have
a quarrel (arrows included) with all those old-timers who think
that the epitome of all amateur radio is to emulate the super
morsemen of the 1930s in the year 2001.

>> Yours in science,
>
>Somehow, this doesn't quite feel like the science I remember.

It doesn't feel like science to me either. Scientists tend to be
more flexible on accepting new ideas than long-time radio
amateurs who don't want anything new to disturb their tales
of derring-do and daring, of being able to leap tall pile-ups,

and destroying infidels and heretics with mighty FISTS of CW.

:-)

> > FISTS says: ACCURACY TRANSCENDS SPEED, COURTESY AT ALL TIMES
> >
> > You disagree?

Of course I agree.
But as usual, the exception to the rule always seems to show up. This time it's you. It really is too bad that you didn't grow up and mature into a real man before you showed up on RRAP. You might have showed some potential as true
Real Ham ï¿½. Instead, looks like you're determined to spend the rest of your ham radio involvement as a malcontent, protesting your own inadequacies by pointing the finger anywhere else. You said that you might just learn the code once no one was "forcing" you to do it. And now this nonsense. So much for your "plans".

Accuracy is more important than speed most CW operations, it's true. Courtesy at all times is definately the preferred rule, but on rare occasions a belligerant, pugnacions induhvidual will appear and insist on blaming all his personal shortcomings and immaturities on those who he envies, becoming critical and abusive, generating a regretable exception to the most desirable rule.

And in your case, of course you have no idea what a CW test actually amounts to. When you take (took) a test at the FCC office they require you to copy a message to paper, any way you can without aid, and when they required the applicant to send code, they had you send a few words from a printed sheet. If the examiner could copy what you sent you passed.
Your assinine assertion that some vaporous "specification" must be adhered to is one of the most brainless ideas you have had to date, and that includes a considerable number of brainless ideas.

The idea that FCC, while downgrading all code speeds should then invoke some closely toleranced "specification" shows just how far you are from reality.
But that's nothing new for you, is it?

Don't know about fun and fast but one tip I can give you is to learn
to copy by hand writting rather than printing. Before I became a ham
I heard one ham tell another he wished he had learned by using hand
writing as he found printing took too long especially at faster
speeds. I used that tip and never regretted it.

8. The Election & the Commission on Civil Rights

Newsgroup: rec.radio.amateur.policy
Date: 2001-01-13 12:31:10 UTC
From: Dwight Stewart <stewartx@sccoast.net>
Message-ID: <3A604A8A.CA8EDA1A@sccoast.net>
Source record: 258
Cross-posted to: rec.radio.amateur.policy,rec.radio.amateur.misc

Since we haven't had much discussion about the election recently, I decided it was probably time to revisit the topic. After all, anything has to be better than the endless no-code debate. Besides, this has it all - the election, Katherine Harris, Mary Berry, Nazi Germany, racism, civil rights, Democrats, Republicans, Bush, the new Congress, and so on. I'm sure there is something in here to interest almost anyone.

Anyway, I watched C-SPAN today as Mary Frances Berry, Christopher Edley, and several other members of the U.S. Commission on Civil Rights, trashed Florida's Secretary of State Katherine Harris during a hearing about "Allegations of Florida Voting Irregularities."

Following almost an hour of often rude questions from the various members, including a request that Ms. Harris read quotes about Nazi Germany from a book, Chairman Berry called Ms. Harris's testimony "laughable."

During Ms. Harris's testimony, Berry seemed particularly bothered whenever Ms. Harris referred questions to Clay Roberts, director of the Secretary of State's elections division, instead of answering the question herself. Ms. Harris repeatedly explained, whenever challenged on this, that it was far better that Mr. Roberts answer the question himself to insure that information given was accurate and complete.

Since Mr. Roberts was sitting right next the Ms. Harris, this logic seemed perfectly reasonable, but that did not satisfy Berry, who made several sarcastic comments, both during and after the testimony, about it.

Following the hearing, Berry said that another hearing will take place soon and that she intends to call Ms. Harris to testify again. Berry also said that she intends to subpoena Governor Jeb Bush once again (he appeared Thursday), concluding that, "I have the power to subpoena anybody and I'm going to use that power."

In spite of several days of testimony, and weeks of gathering information, the commission has yet to find any evidence of illegal activity on the part of Florida voting officials, or a single instance of intentional civil rights violation.

The Commission has been widely criticized in recent years. The appointment of chairman Mary Frances Berry caused a fire storm when it was discovered that she had once claimed that, "civil rights laws were not passed to protect the rights of white men and do not apply to them." [Civil Rights Under Reagan, San Francisco, ICS Press, 1991, p. 141.]

The commission has also been widely criticized for its political makeup. The law says that no more than four members shall be of the

same political party. And, while the commission currently consists of four Democrats, three independents, and one Republican, critics charge that the three independents, which includes Berry, have a long record of supporting Democrat party issues and candidates, and are therefore nothing more than Democrats who call themselves independents.

I certainly hope President Bush, and the new Congress, uses better judgement when selecting members for future commissions. They can start by selecting members who are more racially and politically representative of all Americans, and by avoiding extremists like Mary Frances Berry.

Interesting class of radios to which can be added the new FT-1000 and FT-817 which is a whole new breed of cat. The problem with all of them is that they suffer performance deficiencies because the design intent was to cram as many features as possible into as small a package as possible and compromises had to be made. Not shabby radios at all and they put signals on the air from places where bigger radios are simply impractical. But they just don't cut the mustard for serious vhf/uhf weak signal work.

They'll all hit various vhf/uhf bands and various modes and the TS-2000 and FT-847 desktoppers probably have some decent vhf/uhf performance capabilities. The problem with those is that a serious vhf/uhf operator has to lay down well over $2k for a duz-all-bands (except 222 . .) radio including 9 HF bands + wideband SWL receive in which he may well have no interest. I can't believe that there isn't a market for a >30Mhz all-mode 100w Tech radio which has the features and performance of the "HF/vhf hybrids" and should cost a lot less money. I already have all the HF gear I need. I'd jump all over a radio like that if it was in the $1k range. Ten-Tec had one in the works but the designer quit so they dropped the project. (?!)

Your troll will do you little good, Bill, so stop praying for that break that is never coming to you. You asked the questions, I answered them in full. Very explicitly. So shifting the focal point back on Bash as a person, versus what the overall effects were, is a bit amateurish. If the powers that be want to change the face of the exam structure, they will. Over an 18-year period, I've told them, and you, just how to do it. If they haven't got the stomach for it, it's ham radio's, and ARRL's, funeral. It's that simple. If they want to restore integrity, they will.

That's because you took a knee jerk approach to reading and didn't read on. I've also outlined the details for 18 years, in published form. ARRL has some of those papers. By the way, when I'm assigned national overseer of the exam process by ARRL, and am given a lawyer who knows his/her way around the courtroom, I'll show you how it's done.

>of electrical resistance is?

First, that's not a technical question, which is the
subject under discussion. It's asking for a definition.
Second, I'd wager you never actually saw that question
asked on any actual exam you ever took. I never saw that
question on even my Novice exam. If it's being asked now,
it's time for hams taking those exams to start complaining
about dumbing down.

You're not reading Bill. I'm talking about an example
for college test guides.

You're also not reading ahead before responding. So you're
responding in knee jerk fashion. I end up by saying that
license manuals for Amateurs, _at a lower level_, should
achieve the same goal as a college test guide.

The paperwork wasn't turned in until I had one last chance to save our hides.
:-)

>I guess the DXCC Desk will have to be given over to an
>all-volunteer staff!

With the DXCC fees, DXCC is at least partially self funded. I don't know how
close it is. A number of hams are members of the ARRL JUST for DXCC.

However, if you feel that the money spent on DXCC is better spent and that the
loss of members would be offset by the savings, that sounds like good
information for you to discuss with your ARRL Division Director. He may also
be able to answer any questions about the funding and other financial issues.
The Board meeting is coming up, so now is an ideal time to send him an email or
pick up the telephone.

The FCC hasn't wanted any part of ham radio since at least the early 80s, remember? Remember when Vic Clark's statement was brought in re: the issue has to do with code AND theory, not Morse per se? Remember when you said "that's all bull"? FCC's recent R&O made it quite clear Clark's statement was right on target. We now have no justification for our frequencies as a technical hobby. And that's just the way the "powers that be" want it.

You are right, Len; I had misread your question. I believe that things exist that I don't know about. This could be one of them. I didn't realize that you thought that some people were unaware that things could exist without their knowledge. While I would agree that some people might think that, but I believe it is a very small percentage.

What is your estimate of the percentage of population that believes that things they don't know about cannot exist? Did you ask the question because you feel that I am in that percentage?

I certainly hope not.

>Why would anyone bother with
>trying to guess message content under such conditions?!?

Do you believe a QSO on the bottom end of 40 meters is of the same scope as nuclear war threatening? Under the QSO conditions, I "guessed" because I didn't know what the other guy's problem was and didn't want to get into a discussion about why his sending is so bad. I never imagined that the QSO would be related to nuclear war on a newsgroup. :-)

>of those nets and their vital information on health and
>welfare. Seems to me that message content should have
>accuracy in content. Maybe I'm wrong but I thought that
>someone's health and welfare depends on accuracy, not
>guesses.

You are correct; in any formal traffic handling, accuracy is part of the system specification. Guessing is not allowed. Casual QSOs? Probably the same rule as vocal conversations. If you miss a word that you don't believe to be critical to the flow of thoughts and believe you know what it is from context, do you always ask for a reiepeat? How about at the party where the noise is loud? If the guy who is slurring his words comes up to you and you can't understand part of what he is saying, do you ask for a lot of repeats or nod a lot? :-)

I can assure you, Len, if I am ever handling military traffic because of a nuclear war, I will ask for fills if I miss a word.

Ed,

You said: "The results will be used by the manufacturers to set the
standard at a level expected not to cause widespread interference to
ham radio."

Does that imply that they aren't concerned about seletive
or locally limited interference to ham radio?

Just what does
"widespread" mean in their efforts to limit interference to
my operations and those of other hams?

What about local interference by one of these devices to
my operation if a neighbor installs one?

Cheers,
Bill K2UNK

> code skill...'others' include those not in this newsgroup.

ARRL members liked:
A PIC16F84-Based CW Decoder, Morgantini, Francesco, IK3OIL, QST, Aug
1999, pp 37-40.

Maybe you need a new set of "others" from which to solicit input. The
one you've got now seems to be misleading you.

Jon

While that may be a very specific mathematical answer, the
reality is that there is a practical point at which questions, while
technically different are still essentially the same.

I can ask:

What is the unit of electrical resistance?
or I can ask?
The unit of electrical resistance is?

Different questions but would anyone argue they
are essentially identical as to the memorization of
unit of resistance = ohm

Perhaps so much so that he thinks it is perfectly OK to disregard good
amateur practice. We'll let him address that.

It's the same kind of attitude that Dick and others of his kind appear
to have when they advocate some imaginary rights in amateur radio that
the FCC doesn't grant. I used to let it go by, but no longer.

Even Riley has commented that the worst offenders often hold advanced
licenses and are long time hams. If only the Catholic Church hadn't
taught me to read, I too, could ignore Part 97.

>while technically different are still essentially the same.

Referring to your question about "resistance" specifically, the reality is (1) asking about the unit of resistance is not a technical question, just a definition and (2) a bona fide technical exam won't be asking such a rudimentary question, even at Novice level, on what the unit of resistance is.

And on a general level for actual technical questions, the practical number of ways a question can be asked, a very high number, will far outstrip the person's ability to "look it up."

Bash ONLY published test questions from PAST tests.
If the FCC did NOT change the tests then whose fault is that?
If a college class uses the same test questions year
after year, is that the fault of the study guide publisher?
In another post, Vince claims there's an infinite variety
for test questions. Assuming that is soo, then the FCC
could have given differnet tests every time rather than
repeating them as they apparently were doing.

> It makes NO difference if you or
>> anyone else thought it was cheating, the bottom line

> And it was NOT legal.

It has NEVER ben tested in a court. The fact that a law may
have existed which appeared to make something illegal does
not offer the opportunity to state catagorically that the
illegal act would have been validated as illegal if a court
case was brought. Many laws get tossed by courts when

someone is finally prosecuted for the first time under the law
in question. No such case ever was brought by the FCC
against Bash or anyone else...therefore, no absolute conclusion
can be made as to the true legality/illegality of what Bash
did. We have and will only have opinions of what might have been.

>The fact that FCC wound up not prosecuting him
>for his violations in no way indicate that his actions which were very
>much in violation of law were legal.

Again, your opinion ONLY. The question is? Would the FCC
have prevailed in a case against Bash? That we will never
know the answer to.

> It is revealing that you would suggest otherwise.

It is interesting that you buy in so willingly to every
government law just because it has been passed or
promulgated by an administrative agency. Here in NJ
a few years back the state dept of Health passed
a regulation forbidding restaurants to serve eggs
over easy. The public and the restaurantors
told the dept of health exactly what they could
do with that law by totally ignoring it. Likewise,
the entire driving public routinely ignored the national
55 limit wor over a decade.

Cheers,
Bill K2UNK

You're shifting focal points again. Ham radio is still defined as
a "fundamentally technical" hobby. And the most rudimentary
part of that is knowing basic electronics. In one form or
another, you're always railing against learning the basics.
That's why I say you're basically a no-theory advocate.
That part of your postings _always_ comes thru loud and clear.

C the reason Jesse Jackson wasn't there is because folks sent him
some money for his cause, now that he has some spending money
he will be quite for a while, last seen at a KFC near you.

They keep talking about witnesses and evidence, and everyone keep asking for witnesses and evidence. But, so far, I have not seen a thing other than talk.

> The worst complaint was that there was a
> delay or something made someone nervous.

Good point. Shortly after the election, there were complaints about police at some of the voting booths (it made some minority voters nervious). Of course, in some of the voting districts in the Miami area, I would nervious if there were not any police around. However, I don't hear much about that complaint anymore. Perhaps someone else pointed out what I just said, or I simply missed it. Did you hear it during the commission's hearing?

> Jesse Jackson was conspicuous by his absence.

Ah, Jesse. He does seem to be keeping a lower profile lately (perhaps the Republican demonstrators in Florida were more effective than they thought).

Ed:

I'd have to admit that a 5 WPM code test is better than none at all, but considering that this low maximum level doesn't do much to support continued advancement in this practical communications skill, and isn't likely to do so, I have to be realistic and admit that there is little point in keeping this requirement. For all practical purposes, 5 WPM is, in fact, "no-code" ham radio -- for that's what it gives us as an end result. The former, 3-tiered 5, 13, and 20 WPM code testing regime produced the kind of learning challenge which actually brought new CW operators on-the-air, using the Morse/CW mode. All 5 WPM will do in the future is put an HF microphone into someone's hand or on their desk -- and force us CW operators to hand over large chunks of spectrum presently used by that mode to support growth in the usage of HF phone. Having it "my way" is irrelevant. Human nature being what it is, most people will take the path of least resistance in order to achieve the greatest amount of instant gratification.

Jim:

I learned Morse code at speeds greater than 5 WPM because
it was the current requirement to obtain an Extra-class license!
If the requirement hadn't existed, neither would my achievement --
and I would not have benefited from the enjoyment of reasonable
proficiency in this practical communications skill. It's as simple
as that.

>73,
>Ed Hare, W1RFI

Ed:

I don't know. I can't personally relate to reading a 16-page study
manual to get a General, or any other, amateur license. I became
a ham after years as an electronics hobbyist, and passed my
written tests largely on the basis of knowledge I had acquired over
that time -- through self-study from a variety of sources, and
hands-on experience in project building. I didn't get my ham
ticket for the singular purpose of being able to empower myself
by projecting my voice over long distances at the press of a
button. Moreover, having had that capability for my entire
career ham career, I've always sought, and utilized, more
challenging modes. From a technical standpoint, I don't even
approach the knowledge and experience that professionals
such as yourself possess; but as an AMATEUR radio operator;
I consider myself to be well-qualified to hold the highest, most
distinctive class of license. I've had nothing handed over to
me on a silver platter; in fact, I've had to get over years of
whining for just that to happen before I realized that becoming
a ham meant enough to me to learn the practical communications
skill which is Morse/CW.

Cecil,
Do you think the N.A.A.C.P. Should Boycott KFC?
they are really raising hell here in S.C. about the flag issue.
they even went after a Columbia,S.C. business man because he flies
the confedrate flag at his restaurants.
Anyway next time you look at a KFC commercial look very closely and
think! I remember KFC commercials with the colonel standing with a
family having a picnic behind him talking about good food and family
tradition, today you see a commercial with the colonel ''Moon
Walking'', High Fiving, Shucking and Jiving and Rapping.
Wheres Jesse and the N.A.A.C.P. on this slap in the face?
just a thought.
Donnie

Another point is to write (or print) small. It takes less time to
write small letters and by writing 2 lines in the paper space allotted
for one line, I've found that I can increase my hand copy speed
substantially...

If a college (or the Bash era FCC) does not combat cheating by changing the tests frequently, does that make the person who uses the illicit material any less of a moral cheater?? Is it OK to steal physical property just because someone is careless with it?

>It has NEVER ben tested in a court.

How about in the court of morality?? Did you use those fraternity cheat cheats to get through college, even though there might be no *legal* law broken??

>It is interesting that you [Vince] buy in so willingly to every
>government law just because it has been passed

If (for arguments sake) there wasn't a law (during the Bash era) forbidding the publishing of confidential federal test material, then don't you think that to have one would have been reasonable? The reason being to protect the sanctity of the testing process from both the commercial cheaters and from the buying (soon to be ham) cheaters??

The first message is good advice for those just starting to learn morse...
if you can learn it AND do all your copy by writing in script V.S. printing,
you'll find that copy at higher speeds (as you reach those speeds) will be
easier.

In answer to the second message....
Time-wise, if you spend 20 minutes, 2 - 3 times daily, EVERYDAY (note the
emphasis!) you should be able to pass a 5wpm code exam in a lil' over 2
weeks, maybe 3. (Seems to be about the norm for what I've seen as a VE).
I've heard the excuses before about 'not having the time'... but I doubt
there's many folks who can't find 20 minutes, twice a day, to devote to code
for a few weeks (breaks @ work, get to work a few minutes early, park, and
practice in the car, get up a lil' earlier & practice before leaving for
work/school, skip a TV program, etc, etc....) If you WANT HF privileges,
you'll FIND the time, if not, you won't.

As for "fun".... I and many others I've helped reach 5wpm have all used the
Gordon West 5wpm learning tapes. He's kinda' corny on the tapes, but some
of the corny jokes and puns help the lessons stick in your head longer.

Wow, now that's dictatorial solipsism of the first rank. Certainly as
good as the most rabid caller into any right-wing talk radio program.
In other words, when Vince is appointed dictator, THEN things will be
run right. Sorry, didn't work for Genghis Kahn, didn't work for
Mussolini, won't work for Vince.

I get the impression, from the personality he has displayed on this
newsgroup, that Vince would quickly tire of any collaborative effort.
Especially one where compromise, and tailoring to a realistic world with
realistic constraints, are involved. The ARRL members in the Hudson
Division probably suspected this when they voted against him (by a 2/3
or greater margin) for their Director four times in a row. This may
also be why we will never see Vince sitting on the NCVEC board.

Vince might benefit from that old Dale Carnegie book, "How to Win
Friends and Influence People."

And everyplace you go spell what you see in Morse code. Really.

The charge today can be up to $10 per fcc regulations.
The limit is $10 though. It was $6 when I got mine 7 years ago roughly,
course that VEC didn't charge the full rate, I think the max they could
charge was $7 or something.

>Vince might benefit from that old Dale Carnegie book, "How to
>Win Friends and Influence People."

Glad to see I woke you up finally, Paul. But you neglected to
mention the fact that the fellow who won ran along a no-theory
approach as well, which is one of the reasons we are where we
are. To paraphrase him "you know, there's no reason for Amateur
Radio to be a technical hobby today, simply because there's no
jobs for engineers. You know, my father was a plumber, and
advised me to do the same. Looking back on it, you know, he was
right." Go ask him, he's one guy who is still alive.

Winning friends and influencing people isn't my bag, Paul. The
goal is trying to save the Service, not deep-six it.

Regards, Vince WB2EZG

I don't think that's 100% true, but close. The state of the art today is set by far-end professionals in the biz who have access to pricey CAE software, custom chips, board fab facilities, deep pockets, long list of assets which even most technically astute hams don't have today let alone the rest of us who homebrewed back when. It's just evolutionary reality which started in spark days when somebody decided to make radio parts for money and sell 'em to hams, 1910 or so.

Different strokes for different folks, Larry. After Tiny Tim tried making a baby, he said he hoped he wouldn't ever have to go through that again. :-) Some people feel that way about Morse code.

You would loose that bet as well Cecil, I still am better than you because I do CW and you need to admit that you are incapable of learning a simplistic digital transmission scheme. What did you do 50 years BDSP (before DSP).

A man needs to know his limitations, and the sooner all the CW challenged people admit it the better.

Texas is way out on the fringes of the Old South and I see black
guys on Harleys wearing Confederate battle flags on their heads
and jackets. In Texas, the Confederate battle flag is not a symbol
of slavery but is instead a symbol of rebellion, akin to the
"Don't Tread On Me" flag of yesteryear. Here in Texas, it says,
"I'm still a rebel".

Prices keep going up on everything. More features, greater band
capability equates to more money. If you think that is bad, look
at the ones which have an integral spectrum analyzer for
receiving... :-)

>> Yes, I agree that the 220 MHz band transceivers are scarce.
>> Saw only single-band and dual-band models from four
>> manufacturers covering that band.
>
>The auction is coming . .

Off-hand, based on FCC notices and the general electronics
trades' info, the more important bands for commercial
applications have moved up beyond 900 MHz. The drivers
for moving well up into the microwave region are various
wireless applications and the ability of semiconductors to
work well into tens of GHz. I'd say the 220 band spectrum
is going to stay as it is for a while.

>> I haven't seen any regulation yet on banning homebrew
>
>Nobody has the time to scratch-build and chasing parts is expensive and time
>consuming, there's just no ROI on the dollars or the hours unless it's for
>experimentation. Kit building seems to be on the upswing, however.

The "ROI" thing is individual and subjective. The technology is
known, but the sources of information on it are scattered.

Two examples are the Stoner-Goral-Company's SGC-200 and
Elecraft K2 transceivers. Full circuit details/schematics are
available over the Internet. One can find nearly all of those
circuits' design info in ARRL publications, even the crystal
filters which are hard-wired in from supplied individual crystals.
Microprocessor "control glue" programming is NOT available,
though, and both depend largely on those micros for functional
control and display.

In the world above 30 MHz, the design details are truly
scattered over a number of texts and Application Notes from
a number of manufacturers (Motorola, ADI, National has most
Appnotes on-line at their websites). Test equipment for the
VHF and above range is very expensive, even if bought from
third-hand dealers (presuming those dealers check
calibration). One can't make a SOTA radio project without
calibrated test equipment...probably why so many project
article authors are working as pros in electronics companies
where they can accurately measure radio performance.

didit

PS: Keep a 3/8" open-end, closed-end wrench handy. It is
just right for SMA connectors common at commercial VHF
and higher RF stuff. I think it replaced the pocket protector
as an RF-nerd sign back in the mid- to late-70s. :-)

>and generate another technically impressive 61 lines... 8-0

I gave no "specifications," just generalities of a project personally
witnessed...followed by some offhand guesses of a similar project.

If you've ever done any real programming, you know that few of
them are "simple." I do not count programming exercises such
as those displaying "hello world" on the screen as real programs.
You made some claims without mentioning any personal
experience in programming or which publications had listed
goals of morse decoding other than some vague generalities
that "early magazines used to print [source] code." Oh, wow,
and you criticize others about "specifications?"

Let's talk about "specifications." Let's assume an ad from
the mythical Kilowatter Antenna Company. Which of the
two phrases below would you say are specifications?

Forward gain is 12 dbi min., F:B ratio is 16 db minimum.

"The Kilowatter Swatter-20 gave me DXCC in a month."
[testimonial of Floyd Sphergometer, W2##]

The phrase at the top is the obvious specification. The one
at the bottom is just a claim...something that could be
done with an ordinary piece of wire when ionospheric
conditions are just right. Forward gain of the "Swatter-20"
will hold regardless of the ionosphere and remains constant.
The bottom phrase is emotional loading to convince the
reader they should buy Kilowatter's Swatter-20 but doesn't

say anything specific about performance.

Given the price of Kilowatter's Swatter-20 at $895.95
(list, shipping extra) would you consider buying it solely
on the claim of being able to DXCC in a month? Or would
you compare its specifications and price to other
antennas first?

When you mentioned a morse decoder using an 8080
CPU with 16K of memory you didn't really say anything
about its performance. You really only said one existed
based on remembering one seen as an article in a
magazine. My personal observation of a single decoder
project stated more conditions along with the Goals of
the project: Rate adaptation, timing adaptation to a
certain tolerance for dot/dash/spacing, achieving the
lowest possible signal-to-noise ratio. I had only touched
on "specifications" remembering that the lowest rate was
about 3 WPM morse equivalent and a tested maximum
of 90 WPM morse equivalent. Who said more about a
thing? Me who stated some numbers based on
performance of a working program or you who mentioned
seeing some magazine article?

>A little comedy? OK. I always got a chuckle out of your we-we jokes
>about hams always using the word "we".

I don't say that about "all" amateurs. I only say that about those
who presume to represent all US radio amateurs as having the
same goals-likes-dislikes-fetishes as they.

That is extended to include certain anonymous posters who have
never given their license call.

>
>You're referring to FISTS?

Hello Jon, welcome back? :-)

I used the word 'membership' in my sentence. I have no doubt
that FISTS members are also members of the ARRL. However,
I was not referring to just FISTS members but rather the general
ARRL membership...and the general editorial policies of QST in
regard to selection of material to publish.

>> I don't think so based on input from
>> others concerning their expertise and "necessity" of manual
>> code skill...'others' include those not in this newsgroup.
>
>ARRL members liked:
>A PIC16F84-Based CW Decoder, Morgantini, Francesco, IK3OIL, QST, Aug
>1999, pp 37-40.

All the members liked that? Some members liked that? A few
members liked that? With 170 thousand or so members in the
ARRL, was there also a Poll done to ascertain who liked what?
How does the ARRL decide on what is liked or disliked?

I'm sure Morgantini's article has some merit, is interesting, well-
motivated, and was certainly based on a lot of thought and work
on development of the PIC coding. All such programs and
innovations represent a lot of personal effort.

>Maybe you need a new set of "others" from which to solicit input. The
>one you've got now seems to be misleading you.

Jon, from what you've written, I daresy you are rather
uncomfortable with my opinion. :-)

As a non-subscriber to QST, I cannot hope to compete with an
ARRL staffer who has ready access to the full line of ARRL
publications. I am not critiquing individual QST articles but
rather expressing an opinion on the attitude in general of the

ARRL relative to morse code...over the last few decades...and the attitude of the general membership of the ARRL relative to morse code proficiency being the paramount achievement in US amateur radio.

I readily admit to not knowing the entire scope of amateur radio activity as practiced by over a half million licensed US radio amateurs. To be fair, you should admit the very same thing. Being an ARRL staff member does not give you some magic powers to know the entire scope of amateur radio activity...or radio activity that is possibly related to amateur activity.

Now, now, you are getting a tad testy there, Ed.

There's a common expression in American English, "I've never heard of such a thing!" It is usually spoken with some accusation and punctuated with a verbal exclamation point. Very common expression, not limited to one geographic region.

Do I know the entire scope of activity in radio? No.
Do you know the entire scope of activity in amateur radio? No.

Nobody can know everything happening everywhere.

QST and QEX combined cannot print everything that is done in US amateur radio. The entire published works of the ARRL cannot print everything done by everyone in US amateur radio, let alone done by all hobbyists in radio and electronics.

I described, in general terms, a programming experiment that was done by a non-amateur person with a slight assist from me, another non-amateur person for the purposes of trying to make an adaptive morse code reader. That was not for any sort of purposeful use in amateur radio activity but rather as an intellectual exercise. Intellectual since morse code is not symmetric as are other codings used in electronic communications. After over a century of existance, morse code is fairly stable in structure and any variations are due to human operators both in rate and dot-dash timing relation.
To anyone involved in any sort of communications by

electronics, morse codings are unique. Morse codings are also involved with over a century of mystique and claims which generally have the human operator triumphing over mere "machinery" and claiming superiority. On that basis the exercise-experiment set out to prove that a computer could emulate an experienced morse operator over a wide range of signal environments.

The exercise-experiment was witnessed by two experienced morse operators, one that I saw personally, one that I did not see. A simulation of 90 WPM equivalent morse rate was done where the computer program was able to decode clearly and accurately but neither experienced operator could "read" at that rate except in a few bursts.

As far as I know, none of the participants or their friends and families have ever communicated this experiment in public. Does this mean that the experiment did not exist? No. All that means is that this particular project was never publicized. There is no more "philosophy" discourse on that than for any other project or experiment still being worked on but not yet published. There is no more "philosophy" or existentialism on its "existance" just because so few knew of it. Granted, there have been similar projects undertaken, including one attempt to real-time decode morse on a programmable pocket calculator. Do I know of all of them? No. Do you know all of them? Probably not.

>What is your estimate of the percentage of population that believes that
>things they don't know about cannot exist?

I haven't the foggiest idea. All I can point to is a very common American expression which started out this reply.

>Did you ask the question because you feel
>that I am in that percentage?

No. My public message postings are assumed to be read or skimmed by all who have access. My remarks are to them as well as individuals. In general I've found that strict traditionalists in US amateur radio believe that everything done in US amateur radio is all contained in the publications of the ARRL...but that is my personal observation.

This web page with the same applet works better on my machine.

http://homepage.mac.com/k6mam/MorsePractice/MorsePractice.html

Better yet follow the directions and download the .jar file to your machine and pick up a copy of the SUN java runtime environment and use it locally. It allows you to save your place and not have to highlight all the characters every time you start. Using this applet I was able to pass my element 1 after two weeks. This is a very fine tool and has everything you need including instructions on the Koch method. The price is right as well! Thanks to Martin Minow for the development.

Who is advocating a ONE license "fix?"

As to the zero-WPM...that has nothing to do with
fixing any problem other than the recognition of the
fact that there is no longer any valid reason to
test for code knowledge. It's that simple.

Cheers,

Hey, slick, do you send 35wpm on 3950? Rhetorical question. Don't answer. Go back to 75M fone. Riley will cite you sooner or later.

Sayonara baby.

Perhaps a "Letter to the Editor"...??? Gallup and other polls
manage to determine to within a certain percentage what others are
thinking by sampling only a meager number.

> Jon, from what you've written, I daresy you are rather
> uncomfortable with my opinion.

Nothing in Jon's letter revealed any "discomfort"...Disdain,
perhaps...but NOT discomfort.

> As a non-subscriber to QST, I cannot hope to compete with an

You admittedly don't subscribe. Unless you are using this as a
smoke screen for reading other's copies (mooching) or paying full price
at the stand, HOW can you even BEGIN to form an INFORMED opinion on
what ARRL members think when you don't have the journal in front of you?

Is this the type of investigative research that ENGINEERS are
known for, Len?

> I readily admit to not knowing the entire scope of amateur
> radio activity as practiced by over a half million licensed US
> radio amateurs.

Then the MAJORITY of your posts and rants in this NG are,
esentially, baseless. Without the scientific employment of true
polling techniques, your "opinions" are at best, nothing but emotional
sludge. A hatred built upon your perceptions against Amateurs based
upon your military and dubious professional experiences, but in no way
based upon any practical experience as a Ham.

> To be fair, you should admit the very same
> thing. Being an ARRL staff member does not give you some
> magic powers to know the entire scope of amateur radio
> activity...or radio activity that is possibly related to amateur
> activity.

No magic powers, to be sure, but he, UNLIKE YOU, is involved in
the day-to-day activities of Amatuer Radio. I would take any one
sentence of Jon's assertions over any 10 pages of quotes with footnotes
from you simply because I know he's knee deep in Amatuer Radio.

He knows. You don't.

Perhap if YOU were, your posts might start to reflect some
reality. But I doubt it.

Perhaps if you were ACTIVE on Amateur Radio traffic nets you'd
KNOW that "by guess and by golly" are NOT standards for "word counts"
or missed words. REGARDLESS of the mode.

> Is guessing necessary in all those ham traffic networks
> using only morse? Several long-timers have made much

> guesses.

I have missed far fewer "charachters" on Morse nets. You don't
have accents, speech imediments or other anomolies of the human factor.

You can equally discount those anomolies in digital traffic, but
not everyone carries a laptop and TNC with them. Simplicity.

The quarter million NCT's to whom you refer have not stopped at
NCT, either, Len. Some have, but most have at least taken the 5wpm to
be a "Tech Plus", if not General.

The license demographics are fluid and dynamic. Nailing them down
in ANY kind of a poll would require a very wide spectrum polling.

Not much CW on 3950 Brian. I guess if the local newspaper reports a killing, you assume they are murderers?

While I may or may not support any activity on any freq, the fact I have a link to a site does not imply, nor should you infer my personal position on that link.

The only other person who tried to make these type of connections lives in Mass and is a certifiable nut case, should I infer that you are as well?

I am sorry that your little butt is chapped because you don't know, nor can you learn CW, but that's the way life goes!

I "heard" from a bed-wetting liberal that police "roadblocks" (probably traffic control near the polling locations) were scaring away minority voters. No reason to be scared unless they didn't have a green card or had a warrant out for them.

Besides, most cops I see are minorities. I just don't get it.

It requires one active debvice to tie the knot and then how many tens
of thousands or millions to do the PACRTOR? Meanwhile with a handful of
active devices Fred works the world on CW, using his personally learned
and developed skill. All the programming you can do is for naught
without the complicated hardware to implement it, assuming the software
doesn't lock up the machinery instead of working as intended-far too
often the case.

You'll never win this argument. There is no mode that can favorably
compare with CW on its own turf. The only way you can kill it is to do
your best to downplay its advantages so that newcomers won't want to
learn it.

Can't you just imagine? Instead of tuning the band for the 'weak ones'
we can tune among the spreading sequences to see who's on the air today.
Whoopie!

Exactly what is the conceptual difference between looking at a
digital frequency meter and looking at a digital spreading sequence
meter? Is 12345 a frequency or a spreading sequence?

What? No added swing? No Banana Boat Swing? No Lake Erie Swing?
No Eastern Superior Swing? No extra dits at 65wpm?

Just sterile W1AW-like code?

I'm suprised you didn't miss a few karakters from sheer boredom.

You guys butter your bread on both sides, don't you? Not a consistent
one in the whole lot.

Go swing by 3950 and give your good buddies a hi-5.

Not as boring and you find you are spending a whole lot of time practicing
without really trying.

Just don't pay attention to that dit dah crap if its still around. Such
nonsense. They sound the same ones just longer than the other.

Yep. Your mind was made up the day you tried to operate the Novice band and no one answered your CQ. That was the end of the beginning for you, and you moaned and whined nonstop, to he exclusion of all other constructive activity, for the next dozen years, until Uncle Sam finally decided that your poor pitiful plight needed relief, in the face of the facts.
So now you claim some sort of expertise on 'poor amateur practice'. Of course you can't recognize it when you see it, since you see it in the mirror each and every morning and haven't yet recognized it for what it is.

I've heard there are a few unimaginative sheep who blindly adhere to
that protocol. Most good CW ops prefer to add some personalization,
however. Come back and play when you'd like to be a real CW operator,
as opposed to an automaton.

Good luck on this one now!

OK Mr. Genius, please tell us about your one transistor CW transceiver.
Must be nice not to have to have a store bought transceiver.

The point is: If I can use all the Morse short forms in PACTOR, then
if Morse is a language, PACTOR is also a language. Do you really
think PACTOR is a language?

I've already won the argument, Dick. I can communicate just as well with
a non-English speaking ham using PACTOR as with Morse code. I can do
it without any Morse code whatsoever. So are you going to tell me that
PACTOR is a language?

That wasn't even a credible try at obfuscation. Bash was publishing the questions and answers to **CURRENT** FCC exams. Who would have wanted them if not?

You sure are some logician, Slick.

His superiority will get traffic passed on radiotelegraphy. You know
it. Brainless Burke knows it. NCI in its entirety knows it. ARRL knows
it. FCC knows it, and even acknowledged it- "We believe that knowedge
and skill in Morse code ....etc."
So go right and deny it till you're too stiff to work the keyboard, it
changes nothing whatever of the facts.

You seem to be saying that no individual college exam is that important
in itself, but the entire course, as evidenced by the degree, is.

Doesn't compute.

Either a test is valid and shows to some degree of confidence that the
examinee has absorbed a minimum level of information, else he doesn't
pass the test. Any test that doesn't..... well, fails the test.

Isn't it amazing how the politically correct view pride in anything as "sick".

If they can not achieve, the rest of society must dumb down so they won't feel inferior.

And woe be it unto the person who dares to excel at anything, they have to be racists living in the past. I had to work racist in there somewhere, they always do.

Poor Aaron, can't copy CW and he needs to have someone tell him it is because he is a better person than those prideful old hams that can.

Aaron meet Brian, you can commiserate with each other, only on phone of course!

It happens. Some are the victim of strokes, and may have no facility
of speech remaining. A coiuple years ago I heard a very hesitant
extremely poorly sent CQ and answered it. The copy was horrendous,
barely possible at all. The station was an Extra class, had a very old
callsign, over 30 years old, and was not a vanity callsign. We completed
the contact with difficulty. I'd wager that fellow had some sort of
extreme physical impairment. That may well have been the *only* means he
had of communicating at all. It happens. I've read of quadruplegics who
use a "puffer" switch to key their rigs by blowing air through a straw.
But BrianBurkeTurkey would have Riley cite those guys for "poor amateur
practice". Shows where he's coming from. As far as I'm cncerned he can
go back.

Try QRZ.com's 1993 callbook page. Otherwise, write the FCC to get the letter
that confirms issuance before the magic 1987 date.

Wrong. Although the ARRL and other VEC's may charge $10, there is NO REGULATORY LIMIT, having been removed by a 1996 law change that was previously overlooked.

There is still a general requirement that organizations not PROFIT from amateur radio operations, so any fee charged must be relatively close to or equal cost. The ARRL computed this as $10 to cover its costs, which includes $4 that the VE team may retain for their share of the expenses. The part where fees may be charged for testing costs (or code practice) are still in the regulations.

The alternative way of getting a license, similar to the "Betty Ford" rule for CB, but no marriage or continued commitment required. Better hurry - only 6 days left for "special handling."

However, what's interesting is that neither Paula Jones or Monica Lewinsky have become licensed (to my knowledge) in the amateur radio service.

> When it comes time to do CW, and nothing else, what are you?

I'm a CW ragchewer. My average QSO lasts for about 30 minutes to an hour. These days I generally do 1 to 2 QSOs a day. I don't work DX. I hate contests because they ruin my ragchewing :-). My top head copy speed is around 40wpm, however most of my QSO's are in the 25wpm range. I use a keyer with standard weighting. I don't own a straight key or a bug. I enjoy CW mobile. I keep a CW homebrew computer log. It's over 3000 QSOs now. I dabble in CW computer programming. I don't belong to any CW clubs. I have a number of regular CW friends, some of who are way over the 150 QSO mark in the log, but I keep no skeds, handle no traffic, and visit no nets. I simply enjoy using the mode...

>Inferior to someone who was too lazy to learn it [code]?

You're talking about me. If it wasn't required for my General, I certainly would never have learned the code. And even after getting my General, I didn't start regularly using CW for another 30 years. Yes Dick, I used a mike almost exclusively for 30 years. I'm that guy with the mike in his face that's been described here so often. If there had been no code requirement in 1957 (my Novice) or 1959 (my General) I can safely say I would have never learned the code. I was (am still) too lazy...

On reflection though, I think I must apologize to W4JLE. My attack on him was somewhat sanctimonious. While I strongly disagree that one ham is "better" than another ham simply because of his CW ability, I could have better worded my thoughts...

> I learned Morse code before I ever heard of amateur radio simply
> because it was fun.

BS. You learned the letters, you never have learned it to fluency.
Hence your 5wpm Extra.
Excepting the segment of hams who learned CW in the military, then
later became hams (many did it in the reverse mode, went into service as
hams then became military CW ops), almost ALL hams who learned CW to
proficiency at 13 o 20wpm did it not because they found it attractive,
actually the reverse was most always true. They tolerated that
unpleasant task solely because they wanted the HF ham license.In the
process of learning a high percentage found what Morse code
communications really is about, and went on to like the mode and become
effective trained operators.

The exceptions are the few dingalings like Burke who just sulled up and
stonewalled themselves, preferring to resist by forfeiting a HF license
in favor of "I want". Self-flaggelation at its finest. Of course there
were few of them.

The Proof? Easy. The resounding "wet noodle" flop that has been
Restructuring.

Lets report the facts fully and accurately. The complaint against this restaurant owner was not just that he flew a confedrate flag in front of his restaurants, but also that he also used displays of the civil war as part of the restaurant's decor (this is SC that we're talking about). Furthermore, the NAACP complained that his bookstore (a rack of books in one corner of the restaurant) contained "racist" books that glorified the civil war and slavery.

Less troubling then the boycott of the restaurants, was the boycott by local grocery stores of the popular barbeque sauce produced by the owner of the restaurants. Winn-Dixie, Krogers, Piggly Wiggly, Harris-Teeter, Bi-Lo, and Food Lion, all joined in the boycott by dropping the barbeque sauce. No local grocery store joined in the boycott, and two of the six stores above have restocked the barbeque sauce following complaints by customers.

Now, whatever your feelings are about the civil war, slavery, or the confedrate flag, it is clear that this boycott by the NAACP is nothing more than an attempt to censor the views of this businessman. And censorship, no matter who is doing it, is not that this country is supposed to be about.

The confederate battle flag is not a "symbol of slavery" to anyone displaying that flag. I have not heard a single person, who displays the flag, advocating a return to slavery. Instead, the battle flag is a symbol of State's rights to most southerners (resistance to big government), and a flip of the middle finger at those who criticize the confederate states (especially those who insist the civil war was about slavery).

I saw an article, with similar sentiments, a couple of years ago, written by the black editor of the military's Stars & Stripes newspaper following his return from an extended tour in Africa. In the article, he said that his trip to Africa changed his entire views about race relations in the United States (he then went on to criticize those blacks in American who fail to appreciate the opportunities they have).

Another is short-hand.. ;)
I learned "note-hand" (an abbreviated version taught for easier note-taking in class) which makes it much easier to keep up. I admit I still have a hard time deciphering what it was that I wrote down, but.. getting it wrote down's easier.. ;)

Phil -

Thanks for the detailed listing. This is precisely the program I was referring to, but I was off by 6 months. (I thought it started in Jan 77.) I've added some comments to explain the dates.

On Thu, 11 Jan 2001 19:14:34 GMT, "Phil Kane" <Phil.Kane@nospam.spam> wrote:

This added the ability to pick a specific call, but did not change eligibility.

> 3. Effective October 1, 1976, anyone who had held an Amateur
> Extra class license since prior to November 22, 1967, could
> select one specific "1x2" call sign.

This date (Nov 67) was to preference hams who held the Extra prior to incentive licensing.

> 4. Effective January 1, 1977, anyone who had held an Amateur
> Extra class license since prior to July 2, 1974, could select
> one specific "1x2" call sign.

This was the original date of the NPRM that created this process.

> 5. Effective April 1, 1977, anyone who held an Amateur Extra
> class license since prior to July 1, 1976, could select one
> specific "1x2" call sign.

This was the effective date of the R&O for this program.

One minor correction of what I think is a typo, though, Phil. The present vanity call sign system started earlier than June 1997. For example, check W3OR. He was granted a HV (vanity) license on 4 June 96. The FCC Report and Order was adopted on Dec 23, 1994 and released on Feb 2, 1995. You can find the complete text at:

www.fcc.gov/Bureaus/Wireless/Orders/1994/fcc94343.txt

>> at present, it's a solution to a non-existant problem.
>> That may change, however.

Jim: The "boring" part is due to spread-spectrum not being
intuitive...and few have explained either direct-sequence or
frequency-hopping in simpler terms or in terms that long-
timers can accept. Long-timers referring to being used to
conventional narrowband frequency tuning as practiced in
amateur radio today.

One amateur band somewhere in the spectrum would be
ideal for DSSS or FHSS trials. I would think it woud be
preferrable in an urban area having many potential users,
such as VHF or UHF with a repeater. There is one
problem at present, a very big one, and that is
standardization of the SS characteristics. At present
the characteristics are individual to a manufacturer and
hardly any are alike enough to be interoperable. In order
to use it for a trial, every participant MUST be using the
SAME characteristic.

Spread-spectrum in either of the two main modes is not
that new to the radio industry. The standard small-unit
ground-air-vehicle manpack size radio for the US

military is now entering its 14th year of operational use.
SINCGARs family is FHSS, primarily for extreme
difficulty of unfriendlies getting a sufficient "fix" on the
signal (hops at 10 mS rates, very hard for an intercept).
DSSS is now installed in numbers of hundreds of
thousands, primarily in WLANs and CDMA cell phones.
DSSS with WLANs is so locally secure and free from
interference that it operates just like hard-wired
connections.

> Can't you just imagine? Instead of tuning the band for the 'weak ones'
>we can tune among the spreading sequences to see who's on the air today.
>Whoopie!

Dick: I'm glad you exhibit some joy at new things. For
a while most readers thought you wanted to fix US amateur
radio in the armor-plate-protected, concrete-block
traditionalism of the Olde Days, never ever to change (as
long as you were alive).

Some comments which might aid homebrewers -

Pricey CAE (Computer-Aided Engineering): The ARRL Radio
Designer program set is, what, $150? Allows a circuit
breadboard analysis without buying any parts. Anyone can
download Demo versions from at least three different
software houses who build on the free SPICE program core.
Circuit analysis using the computer as a breadboard is much
faster than building it from real parts, no one gets solder burns,
don't have to buy the components first. Modeled correctly, a
SPICE analysis will work identical to the real thing.

The same for PCB layout programs, at least two Demo
versions having limited size and number of components.
Lacking that, a pad of vellum paper and some colored
pencils work out very nicely...but does take a lot longer
to lay out PCB traces manually.

Custom chips: Not needed for nearly all amateur
applications.

Board fab facilities: For one-of-a-kind boards, one can
get various kits for making PCBs in most electronic
stores. You can choose from room-light exposure to
sunlight exposure from 1:1 scale layouts. Etch them over
the bathroom sink. Clean the foil before and after etching
with ordinary kitchen cleanser. For small jobs I do 1:1
layouts, drill the PCB first, use the drill holes as a guide
to paint on resist made from thinned-out lacquer, then

etch with ferric chloride. No problem but it won't make
0.025" spacing lands and trace spacing, though..

Deep pockets: That's up to the individual on how much
they want to spend. There are pro PCB houses who will
do one-of-a-kind prototype boards, even do layouts first,
but at a price. A few will also do assembly using
controlled-heat ovens, you supply the parts. Ads in
the electronic trades.

SMT: While not stated, this is a big problem for folks who
can't see fine detail or who don't have steady hands. I
would suggest scrounging around for discarded consumer
electronic boards to practice unsoldering and soldering
with suggested soldering tools. Craft stores sell nice,
inexpensive headband magnifiers for looking real close
(cross-stitchers like that type). If the circuit allows
component value measurement, measure before and
after to see if too much heat was applied for too long.

>It's just evolutionary
>reality which started in spark days when somebody decided to make radio
>parts for money and sell 'em to hams, 1910 or so.

There are many places that will sell small quantities of electronic
parts to anyone. Several hams have lists/links to such places.
Allied Electronics has their entire current catalog on their
website. Almost the same for Digi-Key. All Electronics, two
stores in L.A., have a lot of manufacturer's surplus of many
kinds. Fair Radio Sales is still in business and advertising on
the web, still carrying military surplus (but of limited types).

Things that won't be found or are very scarce: Variable caps
other than trimmers or AM/FM radio two-gangers. Tube
sockets and shields (lots of locations carrying replacement
tubes of many kinds). Some ICs that were once common
20 years ago.

A treasure for those working in RF from mid-HF on into the
microwave region: Mini-Circuits passive and active
components. Anyone serious about VHF+ homebrew ought
to have their catalog (order it via website)...contains good
info on component specs, how measured, etc. Harvey
Kaylie's company sells onsies to thousand-plus lots, no
problem. Good rep. in the industry on quality.

>For my own part I hombrew all my antennas including beams and I'm
>mulling building a single 3-500Z amp. Not much else left worth
>hombrewing.

Anyone wanting to homebrew solid-state PAs can contact at
least one website that sells parts or kits of parts for Helge
Granberg's series of Motorola Application Notes (their PDFs

have much larger file sizes and poorer repro than Motorola's website, go direct to Motorola for the AppNotes). The ARRL TIS has at least one article repro on PAs based on the Granberg AppNotes.

Some of the older-package DIP ICs are still available, such as a Motorola phase-locked loop IC with everything available on-chip in stock at JDR Microdevices. There's also some prescaler ICs in DIPs that will work to 1.2 GHz for counting down to a PLL input. VCOs (Voltage Controlled Oscillators) in DIP or discrete thin-film are now the general choice for variable frequency control...the old variable-capacitor tuning method has gone by the wayside.

Rolling-your-own from scratch takes patience, research, study, and a scientific calculator to crunch the numbers. Design data/formulas are all available...but it isn't all available at a single place. Once done, though, one can truly brag about it without exaggeration...it is a unique thing that no one else has done!

Building one's own from a construction article is an exercise in faith. :-) Faith that the author was correct, faith that the publication didn't make a typo somewhere. While typos are generally caught by someone, these "short circuit" corrections seldom appear sooner than three months after an article went to press.

Many VEs will accept a photocopy or a scan of a callbook page showing the class of license. Anything prior to Mar 87 qualifies as a Tech Plus with code and full general written.

Unfortunately, my 1983 book shows her as a Novice (under her maiden name?), and my 1988 book is too late for proof. Perhaps someone else has a book in between that can document her status as Tech.

And if that person is interested in selling that book, I would be interested in buying it! :-)

You gave me an idea Cecil, I have taken a voice recognition program that I had done a long time ago. It is the type of program where each word is displayed and then the human inputs their voice response. Once the word is recognized you can speak faster or slower and it still recognizes the word and prints it to the screen. In any event instead of a voice response, I keyed an oscillator and sent the word in Morse. Once I had set up a few words I then sent faster and slower, used various spacing, and changed the notes pitch. Amazingly it works better than a Morse decoder program I downloaded for a comparison. Using Morse as a language rather than a digital mode seems to work well.

Thank you sending me off in a neat direction!

If you had ever been fluent in Morse you could have passed the 20wpm
test.

Because I don't actually know whats there. You see, I am deaf, and I
must stick to keyboard modes. Just follow the link from the JLE bio on
QRZ.com and read all about it.

It's getting light outside. I have no proof but I assume that
that light is coming from the sun. If it quacks like a Duck ...

> And a built in electronic keyer is not a "key".

A built in electronic keyer is Morse code equipment used by
code-tested hams.

> I have always criticized jammers and other violators, no matter
> what tests they passed.

Proof, please. I just backtracked all your threaded postings.
I couldn't find where you even once condemned code-tested jammers.

You guys seem to be having problems stirring up emotions in the ng's lately! I expect soon you'll be responding to your own posts.

Oh yeah, don't believe everything RUSH and Ollie tell you, they seem to have trouble speaking if it's not reciting the republican line (not like the left is any better). The republican party has more mantras than Jesse and Jonny Cochran combined!

Anyway, now we see the true colors of the parties. Eight years ago the Democrats (what a joke) were crying the Republicans were sabotaging the presidency before it even started. The Republicans spent 8 years and MILLIONS of our tax dollars trying to nail Willy saying all along it was to protect the morals of our country (didn't work). Now the tide has turned and it's starting all over again, only the names have changed.

Have fun!
Jay

I could have easily passed the 20wpm test in 1952. But there was no need. I had *ALL* amateur operating privileges at the time. Unlike you, the purpose of my amateur radio license is for the privileges granted, not for the purpose of beating my chest like a gorilla who learns to count to five.

Fred, Fred, Fred, you could do the same thing with bird calls. There
is much more to human language than your above experiment. Human language
involves the conceptual contextual *understanding* of meanings of language
constructs which is completely missing from your above experiment. As yet,
computers are incapable of *implementing* human language, just as are dogs.

Ain't that the godawful truth! The GOPpers have a naming department that rivals the Pentagon. The estate tax becomes the Death Tax. The completely ridiculous approach that considers a couple something other than two equal singles (and does not apply in Community Property states) becomes the Marriage Penalty. We end farm subsidies (and re-instate them every year since) and call it the Freedom to Farm bill. You can't introduce legislation without giving it a catchy and probably erroneous title. Anyone else selling committe chairs to the highest fund raisers might be called corrupt in other circles.

Fun and games in the old ballyard.

Read it a little closer, Rich. Jim is advocating Morse code testing for any ham who wishes to use CW on the CW segments of ham radio bands. The rest of it is already moot - unless you actually do advocate doing away with CW completely.

>
> The dirty little secret is that pro-code amateurs fight for a code test
> to ensure amateurs are mostly pro-coders.
>

No, that's the dirty little lie promulgated by no-coders. What coded hams who understand the role of CW in ham radio want is for enough hams to be able to use the mode that it is available as needed, and isn't lost to us completely, as many code haters advocate. If you aren't one you could easily be misidentified by your writings.

You need to underestand (evidently you do not) that ham radio is quite different from any other radio service. Our mission is almost infinitely multifaceted, as compared to the narrowly focused objectives of commercial and governmental entities. Just because they have abandoned radiotelegraphy in favor of more cost efficient means, and do not hold any radiotelegraphy assets in reserve doesn't mean that such a plan is appropriate for the amateur radio service, where a large portion of participants use it extensively, and some use no other mode, nor wish to. To ignore their interests just because other later modes are in existance is about as logical as ignoring your left hand just because you are right handed and really don't need that unused left. Hey, just cut it off, the right hand is all I need.

> Some commercial users have valid claims to places in the radio spectrum.
> They have paid the people to use those places. The places occupied by
> amateurs are still owned by the people, in the sense that public lands

So try claiming your personal portion of Yellowstone or Yosemite and see where it gets you.

> People-owned properties should be as accessible as possible to the
> people who own them so that there is the most benefit to the most
> owners. Code testing works against this.

So does all regulation and licensure. So it shall always be, and as people numbers increase so will regulation and restriction of use of limited available assets. Check news reports of newly enacted restrictions on use of National Parks, such as, again, Yosemite and Yellowstone. The several times I've visited Yosemite anyone could drive a private vehicle throughout the entire park. Nowdays you park your car just inside the gate and take a shuttle.

Lamar your point is well taken, but out of date. Mandatory code testing is as good as gone, and most likely will be gone once the international treaty is changed, probably no sooner than 2003 at the earliest.

What is being debated now is mandatory code testing for users of the mode. If you don't plan to ever use it, and don't change your mind, then you've nothing to fear from it. If you want to work radiotelegraphy, you would be required to learn it and pass a test before being allowed to do so. To attempt to work code without any training and practical experience is akin to attempting to fly an airplane without any prior flight training. It will not work, it can't be done. To attempt to transmit Morse code on ham radio while totally untrained is a violation of FCC rules requiring the exercise of good amateur practice.

This is all stuff and nonsense!

I remember when you had a check-box on the 610
in case you were a convicted FELON but during
the Carter administration they struck that down
because the leftists in the government feel the
need to protect the Constitutional rights of
FELONS over the rest of us.

Courts here decided that Convicted FELONS can't
be compelled to register their guns as it would
be a violation of their Fifth Amendment rights!

I think KB1EVA was a plant to make us all look
bad! The FCC under Clinton gave him the callsign!

KB1 Extra Violent Activities!

Jim, ac6tk
PS On my third callsign and they still can't
get it right! (Texas Kilowatt in California?)

An example of a citizen militia rising up against tyranny would be a coordinated, mass demonstration by armed citizens on the steps of the Capital, demanding redress of specific grievances. Naturally, the D.C. Police and the military would be called out, but it would be up to them to fire the first shots on citizens who were simply taking advantage of one of their Constitutional rights. When the "lawful authorities" did fire on such citizens, then they would then be responsible for the beginning of Civil War II. At that point, the police and military, composed of the sons, fathers, daughters, and mothers of the revolutionaries, would then be required to fight against potentially tens of millions of armed citizens who wish to live in freedom from government oppression and tyranny. Those would be interesting times, indeed!

> Ain't that the godawful truth!

Actually no. But what can you expect from a
belief system that routinely lies and disregards
legal contracts between the people and
the government in order to exert their
totalitarian authority.

The commission is an illegal proceeding,
only justified by it's propaganda value.

Considering the routine use of lies, hate,
fear, intimidation and propaganda, I think
forcefeeding NAZI propaganda into the
proceedings sums up the gist of this
exercise in retaliation.

I find that the Democrats often telegraph
their thoughts and intentions by first
accusing others of what they are planning.

In the town where I grew up (and defected
from) they have taken up "Touch Screen"
ballots that don't even offer any physical
evidence that you even voted. Recounts
would be impossible, because the only
way the vote could change is if there
was a loss of data.

Where the HELL are we going.

Cecil, Cecil, Cecil... You missed the whole point, I don't care one whit about the silly definition. I was relaying to you a technical report based on the serendipitous discovery spawned from the argument of language or code.

The point being that the voice recognition software works better than a standard CW decoder. The fuzzy algorithm needed for speech will satisfy copying poorly sent code better than a digital approach.

Thanks to your sending me in this direction, technicians the world over are now freed from the oppression of those nasty CW types that intentionally malformed characters to frustrate the code challenged. The world is once again safe and we can all sleep well!

Total nonsense Cecil! Pactor requires the use of a computer or at least a dumb terminal and a decoding device. What ever display is used has a code page appropriate to the country or the language.

Let's go back to your mythical Jap, his terminal displays Kata Kana, now how in the heck are you going to communicate with him if neither reads the others character set.

CW Now and forever for international communications.

206. Left wingers getting ready

Newsgroup: rec.radio.amateur.policy
Date: 2001-01-14 20:38:03 UTC
From: W4JLE <Fred@w4jle.com>
Message-ID: <93t2q0$619$1@iac5.navix.net>
Source record: 456

Some of the left wing nonsense, this from Ramsey Clark former Attorney General (D)
complete with neutral wording such as "Governor death"... January 20th should be fun. A search of the internet shows all the cock roaches are coming out of the woodwork.

THIRTEEN REASONS TO PROTEST AT BUSH'S INAUGURATION ON JAN. 20

On Jan. 20, thousands of people will march and rally to protest at George W. Bush's inauguration in Washington and San Francisco. We will be demonstrating against the incoming Bush administration and its racist, sexist, anti-gay, militaristic, anti- labor and pro-big business policies. Bush claims to be a "compassionate conservative," but his real "compassion" is reserved for the giant pharmaceutical, oil, banking and other corporations.

We call for a profound social transformation, to a society where people's needs come before profits, where every person has the right to a good-paying job, decent housing, health care, education, childcare and a clean environment. We call for freedom for death-row activist, author and prisoner Mumia Abu-Jamal, Native leader Leonard Peltier and all political prisoners. We cannot rely on the Democratic Party--Clinton led the charge in demolishing social welfare programs, bombing Yugoslavia and keeping the deadly sanctions against Iraq--or on the corrupt corporate elections.

Only a mass people's movement can bring real change, as has always been true. Jan. 20 can be an important step in building this movement, one which links together workers, students, people of all nationalities, women, lesbian, gay, bi and trans people, immigrants, the disabled, seniors and youths.

There are many reasons to join the Jan. 20 counter-inaugural protests. Here are a few:

(1) Bush will become president only due to massive racist disenfranchisement and voting fraud. Not only in Florida, but also across the country, African American votes were disproportionately thrown out. Hundreds of thousands of potential voters, especially in Black, Latino, Native American and poor white communities, have been permanently disenfranchised (forbidden to vote) for having been convicted of a felony. In predominantly African American neighborhoods from Atlanta to Chicago to Miami, outmoded technology and intimidation led to votes being disqualified 20-25 times as often as in adjoining white suburbs. Afraid to be accused of rocking the boat, the pro-system Democratic Party leadership refused to raise the issue of racism during the re-count process.

(2) Gov. Death is moving to Washington. As governor of Texas, Bush presided over more executions--152--than took place in the other 49 states combined during that time. The death penalty is racist and anti-poor. It must be abolished. Bush and his chief law enforcement official, Attorney General- designate John Ashcroft, are rabidly pro-execution.

(3) We must mobilize now to defend women's right to choose. The new Bush administration is anti-women and anti- choice. Women's right to abortion and birth control was won in the streets and it must be defended in the streets. Bush and Ashcroft are both on record as favoring a constitutional amendment banning women's right to choose. Ashcroft is opposed to abortion even in cases of rape, incest or where a woman's life is in danger.

(4) We need funding for universal health care, free education, afford able housing, heat and light, childcare and union jobs, not for the Pentagon. In the richest economy that has ever existed, the basic needs of the entire population could easily be met. Instead of going to meet human needs, how ever, hundreds of billions of dollars annually are spent on destructive and wasteful militarism. The U.S. already has a bigger military budget than the rest of the United Nations Security Council combined. Now Bush wants to vastly increase military spending, including building the so-called "National Missile Defense System." The NMDS is really an offensive rather than defensive system, and is an essential element in a first-strike nuclear war strategy. The Pentagon, which has spent a mind-boggling $4 trillion on nuclear weapons to date, has always refused to renounce the first-strike use of nuclear weapons. Both Bush and his new Secretary of Defense (War) Donald Rumsfeld are ardent supporters of NMDS.

(5) The genocidal sanctions on Iraq must end. In his first speech as Secretary of State-design ate, Colin Powell talked of "re-energizing the sanctions on Iraq." The sanctions-blockade has already taken more than 1.5 million Iraqi lives, half of them children under the age of 5. Powell, Vice President-elect Dick Cheney, James Baker and other George W. advisors launched the Gulf War 10 years ago during the regime of George Bush I. Clinton carried on the sanctions and bombing throughout his eight-year term, and now the new Bush team wants to further step up the war against Iraq.

(6) Stop U.S. intervention in Colombia and all of Latin America. The incoming Bush national security team wants to escalate U.S. intervention in Colombia beyond even Clinton's Plan Colombia. And it's not just Colombia--there is also the threat of wider intervention in Venezuela, Ecuador, Bolivia, Peru, Mexico and Argentina, where people are rising up against the domination of the International Monetary Fund, World Bank and U.S. corporate domination. We must act now to stop a new Vietnam War in Latin America.

(7) The incoming Bush administration is filled with vicious bigots who want to turn back the clock on gains won by lesbian, gay, bi and trans people. Bush is allied with the bigoted religious and non-religious extreme right who want to deny equal rights to lesbian, gay, bi and trans people and force them back into the closet.

(8) The 40-year war against Cuba must end. Bush, like the nine presidents before him, wants to turn Cuba back into a colony of the U.S. as it was before the 1959 revolution. It is time to end the blockade and aggression against a small neighboring country and let Cuba live in peace.

(9) The Bush administration wants to speed up environmental destruction for the sake of corporate profits. Under Gov. Bush, Texas ranked 50th among states in air quality and first in toxic polluters, toxic releases, carcinogens in the air and 13 other polluting categories. Bush put polluting industry representatives in charge of the state's Natural Resources Conservation Council (Texas' version of the EPA). Bush and his nominee for Interior Secretary Gale Norton want to open the Arctic National Wildlife Preserve to oil drilling, just a hint of what is to come unless we mobilize now.

(10) Support an independent home land for the Palestinian people. The U.S. has given Israel hundreds of billions of dollars in aid over the past 50 years, aid used to repress the Palestinians. The U.S. government and Israel are acting as a team against the Palestinians. There will be no peace in the Middle East until there is justice for the Palestinian people.

(11) End U.S. colonialism in Puerto Rico--U.S. Navy out of Vieques! The Bush administration's plan for military expansion includes keeping the island of Vieques as a bombing range. Many Puerto Rican people have been killed or injured, and the environment and economy of Vieques have suffered much destruction. Now is the time to support the Puerto Rican people in their struggle to get the Pentagon out.

(12) Shut down the prison-industrial complex! The U.S. has 5 percent if the world's population and 25 percent of the world's prison population. This amounts to over 2 million people, a majority of them African American, Native and Latino. Prisons are all about brutal repression and super-exploitation against the poor and people of color, not rehabilitation. The economic basis for all of this repression is profits. Wall Street firms and banks invested an estimated $41 billion into the expansion of private prisons last year. Prisoners are forced to work for slave wages for high tech, manufacturing and service companies. Under the Clinton/ Gore administration, more prisons were built than universities. The Bush administration plans to continue this trend. A national movement must be built to shut down these concentration camps. Our youths need union jobs and good schools, not incarceration.

(13) We will march on Jan. 20 to say NO to the anti-worker Bush regime. Bush's Secretary of Labor candidate is an extreme right-winger who is anti-civil rights, anti-women's rights, anti-lesbian and gay, anti-disabled persons, anti- immigrant and ANTI-LABOR! Linda Chavez is the dream Secretary of Labor--for the corporations and bosses. Appointed by Reagan to head the U.S. Civil Rights Commission in 1983, she worked to reverse all the gains of the civil rights movement. Chavez is opposed to there even being a federal minimum wage.

I believe that to be his point; the testing for Morse code should be on a par for the testing for other modes. The only mode that is not optional on HF is Morse code.

Why would testing of the encoding method used in Morse code be necessary before granting CW access in the CW portion of the band. Are you afraid hordes of people will learn Morse code wrong and try to get on the air? Those that learn the code will use the mode, just as badly as I did at first and will improve with time if they stick to it.

Would you advocate that the VEs determine that a ham has working RTTY equipment before he or she is permitted to use RTTY on the digital portions of the bands?

>you could easily be misidentified by your writings.

I am not a code hater, Dick, so let me add my two-cents worth. IMHO, everything that is good about Morse code on April 14, 2000 was equally good on April 16, 2000. The value will continue to be there if the code tests are removed entirely. I agree that fewer hams will try it, but I also don't believe that its use will end any time soon, if ever, in the Amateur bands.

I believe that the harshness and anger I have seen expressed here by some of the pro-code-test folks is turning people away from the mode. Why do you believe that some of those who say that they want to retain Morse code testing to help preserve the mode are engaging in conduct that is helping to drive people away from it?

>From: Dick Carroll dixie@townsqr.com

>You need to underestand (evidently you do not) that ham radio is quite
>different from any other radio service.

It was not significantly different from other radio services when it was created, Dick.

Do you believe that if ham radio had been created deliberately to function entirely differently than the radio services of its day, that it would have attained the level of respect and value that helped preserve it through decades?

>Our mission is almost infinitely multifaceted, as compared to
>the narrowly focused objectives of commercial and governmental entities.

I agree; our diversity is our strength. Having a test that emphasizes one mode over all others is not "infinitely multifaceted" and cannot be expected to foster that diversity in the Amateur Radio Service.

>Just because they have abandoned
>radiotelegraphy in favor of more cost efficient means, and do not hold
>any radiotelegraphy assets in reserve doesn't mean that such a plan is

Everyone can visualize that, Dick. It still doesn't make Morse code
a language. Those words you are copying in Morse code are *English*
words.

Actually, it is not a language - for you it is obviously a religion.

I found out about it in Cub Scouts. My cousin and I learned it
together but not for a merit badge. We used it for secret messages
in the middle of the night. We were about ten years old.

>Does that imply that they aren't concerned about seletive
>or locally limited interference to ham radio?

>Just what does
>"widespread" mean in their efforts to limit interference to
>my operations and those of other hams?

Let me preface my answer with a bit of background. First, these devices are quite legal under Part 15 rules. They will need to meet the limits for intentional radiators on HF. It would be perfectly legal for a manufactuer to make an intentional emitter that creates a field of 50 uV/m at 30 meters distance from the radiating source. On 3.5 MHz, this translates to a an S9+10 dB level signal. There is a further provision in Part 15 that requires that such a device not cause harmful interference.

The levels that they are notching are 30 to 50 dB less than what is permitted under Part 15 rules. They don't have to do this, except that they are trying to avoid the interference reports that will inevitably result if they don't. The industry has learned from the lessons of the wireless modem jacks that are being removed from service by AT&T.

The levels for the notches being considered would result in approximately 0.01 microwatts being radiated from an inefficient radiator (the power wiring inside a home) in the typical bandwidth being used by hams. Compare that to the permitted spurious emissions level permitted to hams of 50 milliwatts from an HF transmitter. We are allowed about 67 dB more radiation from our harmonics in our neighbor's TV channel than they are proposing to use in the ham bands.

The general goal at this stage is to ensure that one of these devices installed in a neighboring home will not cause harmful interference. I don't know where the FCC would draw the line on what constitutes "harmful interference," btw. I don't know if the product can be made that good, but ARRL is going to work as closely with an industry that wants to do the right thing as can be done. From there, it may become a regulatory matter.

Sooner or later, with this type of product, the line will be crossed where harmful interference will happen. I suspect that apartments and indoor ham antennas may be a problem. Of course, that already is a problem with many other types of devices. Interestingly, at KB1BE, one of the fluourescent lights in his basement radiated about 10 dB more noise than did the test signals we were coupling into his residential wiring. Part of his antenna was located 15 feet from the house, FWIW.

I don't know how all this is going to turn out, Bill. I do know that there is a limit to what ARRL can ask them to do voluntarily, and that the regulations would permit them to do NOTHING voluntarily.

>What about local interference by one of these devices to
>my operation if a neighbor installs one?

I also raised the question of susceptibility. Although not a rules problem, susceptibility issues DO cause grief for hams with neighbors who don't understand the rules. At this stage, I have a general agreement that they will get some beta units to me for testing purposes.

More to follow, in a more public venue, as soon as more is known.

As an aside, a similar product, home phone networking, has notches in the ham bands. When I met with a rep from the Home Phone Networking Alliance, we tested both immunity and radiation. At W1AW, the one we tested was virtually immune, although with closer antennas, there could have been problems. This rep, btw, is Steve Strauss, NY3B, who is now a member of the ARRL RFI Task Group. Ron McConnell, W2IOL, a rep from one of the VDSL committees, is another.

It is absolutely wonderful to see that, if approached and made aware of ham radio, the industries are willing to take steps to address harmful interference, at least in these cases.

We can all be glad that Larry is permitting this work to continue instead of selling the building and taking out a few prime-time TV ads. :-)

Nope, Japanese terminals either display English characters or allow
the kind of characters to be selectable. You see, the Japanese, long
ago recognized the superiority of a 26 character alphabet and adopted
Romanji for their computer systems. Thus I can send, using PACTOR,
"RST is 579" and my Japanese friends can understand it perfectly
with no Morse code involved. Thus, if Morse code is a language,
then PACTOR is also a language.

I was applications manager for OKI Semiconductor for a number of
years. The parent company was Oki Denki and many of their employees
were hams. All of their personal computers used Roman (English)
characters. Almost all of those hams operated their personal computers
in English, just like I did.

I believe that most of the strings of dits used for jamming are probably sent with the internal keyers that have been part of most HF rigs for over a decade now. A plug and a wire is all that is needed.

I have no doubt that some of those keyers are also used for Morse code. I also have no doubt that some of them are not.

I have no basis on which to even speculate as to the percentage. Do you?

>keep the Morse code requirement, the ARRL should be renamed the "Antique
>Radio Relic League".

I don't know what the Board has in mind, but it will be considering this very issue at the January Board meeting. If it didn't think that a change in policy was possible, it would not have to consider the matter at all. It has an existing policy right now.

> I am a current member of the ARRL by the way, and I am
>using my membership to send my view to the ARRL leadership that the Morse
>code test requirements should be dropped at the next WARC. It's high time
>ham radio moved in to the future. I am working from the inside to change
>things, and I would urge others, who are not currently ARRL members to join,
>and make your view known, one way or the other.

Although I agree with the reasons to join the League, I will also add that you do NOT have to be a member to voice your opinion. In the first place, the Board members generally don't take the time to check each and every input to see if the correspondent is a member. Especially in this matter, the Board is quite aware that a number of hams are not members because of what they see ARRL's position on CW testing to be.

I am going to make my views known to Tom Frenaye, and I urge others to do the same with their Director, even if they live in the New England Division and want to cancel out my vote.

See http://www.arrl.org/divisions and follow the email links.

Actually, I am an old hippie, though I never did make it to Woodstock. There was a lot of good and bad in those days, and I tried to hold on to the good.

I am glad that I learned that the problems of the world are not solved by singing songs in the park. We did that on days we weren't solving the world's problems, too.

Actually, the lessons I was opining about were the ones I learned in Sunday school. Maybe I was niave, but I still believe in some of those things. :-)

My guess is that they were probably infirm and just loved CW too much to give it up. That is why I did my best to give them QSOs, though I must confess that I did cut the QSOs short.

My statement that the sending was bad enough to be considered in violation of good amateur practice does not mean that I feel the operator should be prosecuted.

'Sides, I am not an OO. :-)

Cecil:

Of course it is, but that gratification is delayed by the necessity to learn the Morse code and gain satisfactory proficiency in that skill. Plugging a microphone into an HF rig, pushing the button and talking is "instant" gratification, therefore, the strong push to eliminate remaining code testing requirements. Of course, this is obvious to everyone but you.

Cecil:

No, I'm saying that I respond to incentives do do things, like everyone else. Ham radio is not a necessity of life, like working at my job in order to make a living. I do a lot of things on the job with the only incentive being that I need to keep my job and progress within it. As a radio amateur, I required an incentive to seek higher privileges, because I could have chosen to whine on 2-meters for the rest of my life while waiting for code testing to be abolished. That didn't work for me, because I wanted HF privileges then and there -- without waiting for them. Thus, my incentive to learn and gain practical proficiency in Morse/CW -- a mode which I have enjoyed greatly ever since I was "forced" to learn it!

Hope so. Wonder if he was listening earlier also?

At around 9:15 AM Central on 14.313 on 14 Jan 2001
two stations from a maritime "net" on 14.300 helped a maritime ham station phone
patch to an individual who openly announced on the patch
that he was not a licenced operator but would meet up with the maritime
ham regardless, on the frequency of 12.350 mHz USB.
Listened on 12.350 after their 14.313 ham "phone patch" was concluded.
They used the callsigns "sasperella" and "shooting star".
Whole activity was questionable from beginning to end.
Nice to see that 20m ham nets facilitate comms on non-ham freqs
by potentially unauthorized individuals. Makes the Service look real nice.

Did you hear this too R.H. ?

That would be a valid reason IF there was a government
need for amateurs to attain that skill. You can argue that
as you choose, but I fully believe that you'd never convince
the administrations of the world that the skill is needed
today.

Cheers,

If I understand what you've written, the person on the telephone
said he was not a ham. That's perfectly acceptable.

>Listened on 12.350 after their 14.313 ham "phone patch" was concluded.
>They used the callsigns "sasperella" and "shooting star".

Those would probably be the names of their boats. Boat names in
lieu of callsigns are permitted on the VHF marine channels --
perhaps the FCC now permits that also on the HF marine frequencies
now.

>Whole activity was questionable from beginning to end.
>Nice to see that 20m ham nets facilitate comms on non-ham freqs

Coordinating two boats to meet up on a marine band frequency
is perfectly acceptable.

As a matter of fact, one by one, those administrations of the
world are indicating by their actions that they don't agree
with Larry. Didn't I read that Canada is in the process of
adopting a 5wpm maximum code requirement?

Yeah, but what is the internal noise level? They speaketh with forked tongues. The Icoms of the world know that most of the users will be doing non-critical FM yakking with the baby boxes. When one gets into moonbounce, very weak cw and ssb tropo scatter work etc. the performance requirements get a lot stiffer in areas like noise figure, dynamic range, filter quality, DSP capabilities, etc. where the desktoppers have the advantage over the "radios of convenience".

I'm not sure I agree that prices are actually going up - depending on how you define "prices". My sense is that given a constant $2k the bang for the buck has been rising at a very significant rate. Over the long haul in time a ham today gets a helluva lot more capabilities and performance per on-the-job labor hours than he could years ago, no comparison. A Collins S-Line sucked up say two months worth of paychecks in 1970. Today two-three weeks worth of paychecks gets an xcvr with far better capabilities, a big increase in features and better performance than an S-Line has. Very roughly speaking. Those so-called spectrum analyzers are a flaming joke.

I agree that hams in the centimeter bands have a lot of pressure which can only get worse. But I can also visualize 222-225 being eyed by the aviation folk who are already in that neighborhood and have a big spectrum crunch.

Goes beyond that. The ham who works 40 hours per week and lives an hour away from the job will use a different ROI yardstick than a retiree will. I'm still doin' my forty plus, I'll build but only when it makes a lot more sense than buying, usually when what I want isn't in the catalogs.

>> According to the www.icomamerica.com specs, the receiver
>> sensitivity is down there near internal noise limit.

>Yeah, but what is the internal noise level?
That is exactly what a sensitivity measurement measures.

> When one gets into moonbounce, very weak cw and
>ssb tropo scatter work etc. the performance requirements get a
>lot stiffer in areas like noise figure,

Noise figure is another way of expressing sensitivity.

> dynamic range,

Dynamic range is a measure of the ability of a receiver to remain sensitive in the presence of strong signals not in the passband of the receiver. IMHO, the dynamic range of most receivers sold to hams is adequate, most of the time. EME enthusiasts usually do not schedule their events and QSOs the day of the ARRL VHF Sweepstakes, when there are apt to be strong signals up and down the band. If those strong signals are not present, dynamic range is not usually a receiver issue.

> filter quality,

Filter quality does sometimes buy you something. If you are listening to a weak one and there is a strong signal just outside the filter passband, it is nice to be able to get rid of it nearly completely. Most of the time, though, the filters in the intermediate-priced rigs are quite adequate for the task, and if those strong signals are not present just outside the passband, the improved skirt selectivity of some of the higher end rigs has no significant effect on what is heard in the receiver baseband.

> DSP capabilities, etc.

For the most part, DSP=filtering, wtih some dynamic range implications. Actually, in the areas you cite, the DSP implementation in the big rigs results in a poorer close-in dynamic range (<20 kHz spacing) than does the use of a moderate filter before the high-gain stages of the receiver. Some DSP radios do use such a filter, but in those cases, the DSP is a secondary benefit, with the filtering providing most of the selectivity.

>where the desktoppers have the dvantage over the "radios of convenience".

I agree, on the whole, the >$3000.00 radios have better performance capability than the radios in the $1500.00 price class. The ham who erects the big tower and high-gain antennas will need every dB of dynamic range that is available.

The ham who has a modest antenna system, though, probably will not. For that ham, a low-end radio makes a lot of economic and technical sense.

Speaking of dynamic range, the best dynamic range ever measured in the ARRL Lab at 5 kHz spacing belongs to the Elecraft K2 on 20 meters.

Try english sometime, but back to your wager.

That counts me out since I not a no-coder, but I suspect that you would
hurt yourself just to try to prove a point. I'll put a dollar on the
crazy Extra who's so full of himself and has so much to prove.

That is exactly what is needed to influence ARRL policy. Hams should also make their views known to the FCC when such matters are on the regulatory plate. They should also support organizations that represent their views, such as FISTS or NCI.

Here are the terms. Let's select someone with a no-code license and you. He or she will be asked to construct a Morse-code transmitter and make a Morse code QSO. You will be asked to construct a spread-spectrum transmitter and make a Morse code QSO. Winner gets an ARRL Handbook from the "bent-cover" bin.

I will answer the first question later in the week when I can type out a long answer.

I cannot answer the second because I do not believe that we should have a one-class license system. I also do not believe that our licensing system should contain no Morse code testing. I believe that Morse code proficiency should be tested the same way we test for proficiency in other modes.

I have always agreed with the need for good amateur practice, Brian. I just don't agree with you that deviations from standard spacing that can still be easily copied by most operators is not good amateur practice.

>I'm always amazed at how people will abandon
>reason just to argue with me.

If you think that the only reason I hold my view is so I can argue with you, you are quite mistaken.

>If they so vehemently object to what Part 97 says, they ought to try to change it.

As can you. I don't recall that you have filed any RFMs about the need to closely control the spacing of sent CW. To my knowledge, no one has ever received an NAL for poor CW timing, so obviously the FCC and most of the amateur community believe that existing practice is adequate and is within the letter of the law.

You ought to try to change it.

The bottom line, Cecil, is that such sharing is going to take place whether hams use SS on those bands or not. The proliferation of unlicensed devices, some of which are permitted 1 W with unlimited antenna gain, on some of "our" microwave bands is already starting to have an effect.

It remains to be seen whether the FCC will back ham radio in cases of actual harmful interference. Even if they are willing to do so, the problem of locating individual offenders is a daunting challenge, and the problems of aggregate noise levels from multiple devices may represent something the FCC won't address. I am doing what I can to deal with this one, but I am not making any promises.

What is the significance of 1999? Restructuring and the "nickle Extra" took place in April, 2000. If that's what you're talking about, you'd have to say "The pre-4/15/2000 Extras," to indicate Extra-class operators who had taken and passed the 20 WPM code test element.

Teachers Unions? No, putting it on the VEs was offered as an unworkable solution.

OK, after each exam session, one of the flunkees takes control of the test material. The flunkees then go through the material, exam by exam, and raise questions about the ones marked in red. After all of the incorrect answers have been reviewed, the flunkee reassembles all of the exams, QA sheets, written exam and code exam answer keys, and copies of the CSCE's in their proper order and eturns them to the lead VE.

I agree. This can be done without the VE's assistance. Why should they need absolute control over the test material?

New Count Shows Bush May Have Won Popular Vote
NewsMax.com
Wednesday, December 20, 2000

Despite the widely accepted claim that Al Gore won the popular vote by some 300,000 votes, a new count of state totals appears to show George Bush was the real winner by nearly 2 million votes.

According to respected news analyst Mary Mostert, a report sent to her by reader Don Boyd showed that Gore got a total of 50,753,172 votes nationwide while Bush got 52,685,804 giving him a winning margin of 1,932,632.

Wrote Mostert "While I have not checked all 50 states with the Secretary of State official returns, I have checked all the big states and a number of the smaller states. All the ones I have checked are accurate, or modified very slightly with late absentee ballots, which tilted towards George W. Bush. For those who want to personally check these figures, go to the "Original Source" which has all the election information by state. Nearly all the states now have their OFFICIAL, returns posted.

These figures were reportedly obtained from the Office of the Secretary of State from each state but haven't been confirmed. Where are Al Gore's cheer leaders known as the news media??

No they haven't been confirmed and in fact if they have, why hasn't
this total appeared on the ABC News web page ?

Hahahaha.. this is so typical of the right wing Limbrain cabal.

I would have, Ed. I only got the conditional license so I could
continue operating 40m CW in the Novice bands.

You missed his point, Larry. Did anyone require you to achieve
a Morse code speed in excess of 20wpm? If not, why did you go
above 20wpm?

Well Folks,

With all the sound and fury signifying nothing I just had to look into Fred's bona fides, very interesting reading.

It seems that just before the change in the code requirements Fred was and Advanced Class amateur holding the call W4JLE now it seems he hold an Amateur Extra license effective June 03, 2000 this is well past the change in code requirements for Amateur Extra. One can only presume from all this that Fred waited until the code requirements were reduced before upgrading. The question is, why?

In my own cynical way I have to presume that Fred, despite all the sound and fury, was unable to pass Element 1C and so had to wait until the bar was lowered to get his Amateur Extra. This casts doubt on all of his blathering about traffic handling, superiority, the value of other, etc. I'm sure there is a wonderful excuse and lots of aspersions to be cast at me for this revelation but the public record speaks for itself.

In the hash light of these new revelations I am forced to conclude Freddie had been fibbing to us and I'm afraid I won't be able to consider anything he says from now on to be credible. Oh well, he never had anything interesting to say anyway. Please be careful Fred, word on the street is that you go to Hell for lying.

I didn't get involved in this thread because of that, Dick. No, I bothered reading the thread because a pro-code proponent expressed that he wasn't surprised that a NoCode licensee killed someone. That's pretty inflammatory.

But, it is not yet a done deal. ARRL is soliciting comment on whether they should change their code stance or not -- while it may not change the WRC outcome, it certainly could change how the FCC deals with the WRC results.

> What is being debated now is mandatory code testing for users of the

> you've nothing to fear from it.

You know, that is an interesting proposition. But is it practical?

> To attempt to work code without any training and practical
> experience is akin to attempting to fly an airplane without any prior
> flight training. It will not work, it can't be done. To attempt to
> transmit Morse code on ham radio while totally untrained is a violation
> of FCC rules requiring the exercise of good amateur practice.

Why can't I work CW with my MFJ 1278 (it _does_ do CW)? Do I need the training in manual CW to enjoy automatic CW? Should I then be required to learn to copy Baudot or ASCIII by hand before using the same 1278 to work RTTY, AMTOR, or PacTOR?

With the 1278 on my rig, you wouldn't be able to tell if I were working manual or automatic.

And, there is really no difference in the use of the 1278 for automatic CW and the use of 'contest keyers' to make endless CQ's easy.

It's not at all akin to flying an airplane -- it's more akin to using a calculator without knowing how to do it by hand.

EME aside, the guys who are VHF contesters or dxers and the band is open need all
the dynamic range they can get just like the lowbanders do. All ya need is two of
those critters on the same block on the air at the same time.
>

>
Absolutely. Much of the need for filter quality is a function of what one does with
the radio. The casual ragchewers aren't as demanding as the dx contesters for
instance. Getting off the VHF thread a bit one does not want to go into the piles
on the bottom end of 80 in the big dx contests with mediochre filters or dynamic
range. Collins and Inrad filters are worth the money to those who can justify the
additional expense.

DSP technology simply is not yet ready for prime time in this respect. Needs to be
moved out to the antenna connector then we'll see it catch up with the Real Filters
in the IFs.

Whizzy little box. My JRC NRD-545 didn't come in far behind the K2 in your
front-end tests. But I'll tellya what: The 545 is one of those filterless all-DSP
radios and as far as the skirts go the cascaded Inrad filters in my antique
TS-940SAT spank the pants off the DSP skirts of the 545. And the 200Hz xtal filter
in my 75S-3B artifact take it one more step.

Actually, there is quite a significant a difference.

For the other digital modes (ASCII, Baudot, Pactor, Amtor, etc) the sending transmission will certainly be machine-generated. In the case of CW, that is the exception. From my experience (and from reading other peoples results too) the machine CW readers typically have major problems decoding anything that is not machine-generated.

RUSH? OLLIE? Who are they? Not anyone I ever listen to. I couldn't tell you when either is on what media or where. I know what I believe. I imagine those guys are right a lot of the time, too, but I don't use my time to listen to any of it. And I turn the channel with the Big Creep comes on the tube, Big AL too. hope I don't have to develop the same outlook on Dubya. Don't think it'll ever happen. I know I won't on Cheney.

I got an email a couple days ago from a young relative in California wanting everyone to sign a petition to have The Big Creep sign the Alaskan wildlife something-or-other into a national monument so no one

can ever drill for oil there. Young feller meantime is about to find himself sitting in the dark and cold because the stumblebums that pass for government officials there don't have sense enough to know that their electric utilities can't buy high and sell low without eventual bankruptcy. Whatta buncha clowns. I guess they've already got all the Ca coastal oil locked away. Guess they can always use candles. Won't do much good for all their Silucon Valley servers though. So much for High Tech.

Don't worry about 'em, Fred, they're relatively harmless. They just
make a lot of noise and consume bandwidth.
Real people keep their rifles in the closet. All those nuts have is a
bumper sticker that says "Gunfree and Proud of it".

That remark is inconsistant with reality and you know it. But then much
of what goes on in the regulatory world today is.

Bet you a lobster that the same thing occurs when the do dropthe code
test entirely.

What happened to all those hoards of CBers and
> freebanders that you predicted would invade the ARS?

They arrived early. In the form of lots of no coders and slow coders.
No real surprise, lots of them have came through the VE system. And many
have gone on to other more productive "freeband" activities where they
find conditions and 'services' better than 27 mhz and they don't have to
put up with dodging ham radio regulations and renewed enforcement.
Things do evolve. Ham radio is evolving -mutating would be a better
choice of words,like a cancer- into something unrecognizable. Ah well,
no good thing lasts forever. Ham radio is no different in that respect.

Hi Lamar,

You are right about what started this, but of the 384+ postings, this thread spin-off from prior, repugnant topics almost ceased from the beginning to conform to that trash. There are hardly more than 4 or 5 that responded to that where the remaining 380 postings have simply focused on the obvious inflammatory subject of the CW requirement.

I suppose that the originator of this (not W. G. Ewald, but Fraudtenna) might clamor that those 380+ postings are off topic, but thankfully Fraudtenna has abandoned the dung heap they tried to build as a monument to their moral authority.

In a sense, the topic No-code kills has evolved into a statement that no-code replacing CW requirements is killing amateur radio. That certainly is inflammatory enough to stimulate the number of postings and participants.

Before the
FEDERAL COMMUNICATIONS COMMISSION
Washington, D.C. 20544

January 15, 2001

In the matter of)
)
Amendment of Part 97 of the) RM-10018
Commission's Rules to Allow)
Increased Frequency Privileges to)
Amateurs having Proficiency in)
Telegraphy in Accordance with the)
International Requirements)

To: The Commission

COMMENTS ON RM-10018

The commenter, Hans Brakob, an FCC Amateur Radio Licensee
for several decades, assigned station call K0HB, agrees
in principle with the petition of Joseph Speroni, AH0A,
and proposes an expansion of the frequencies allowed.

1. Because of attrition (no new Novices being licensed),
current Novice licensees (and Technician licensees who have
passed the 5WPM Morse code test) face a continuously
diminishing ability to engage in Morse contacts in their
current CW band segments.

2. While these segments are also available for use by other
license classes, most licensees with higher class licenses
tend to avoid the Novice sub-bands so as not to infringe
on this reserved practice territory. This well-meaning
reluctance to infringe may be misplaced, but it is real,
and has at least two undesirable consequences.

3. First, it creates an "ghetto" where Novices are isolated
from mainstream Amateur Radio and do not gain exposure
to the benefits of interacting with more experienced and
skilled operators, and

4. Second, because of attrition, these already-underutilized
band segments will see less and less activity while other
adjacent segments become more crowded because of increasing
popularity of other emerging data modes like PSK31.

5. I further propose that this concept be applied to the
"General" segments of all MF/HF amateur bands, not just the
4 bands proposed in the instant petition. If Novices were
allowed to participate in the full range of CW operations
(CW only at reduced power of 200W) on all bands, such as
traffic handling, radiosporting ("contests"), and DX�ing,
they would be much more likely to gain in skills and enthusiasm,
and aspire to gain the theoretical knowledge to upgrade to the
increased power and mode capabilities of General or Extra
license classes.

Respectfully submitted,

H. Hans Brakob, K0HB

Nice quote from Macbeth, however I happen to have a certificate from a midnight session of the last day showing I upgraded under the old scheme. Never really cared about getting the Extra until they were about to remove the code requirement. To be honest, I have been laying back in the weeds waiting for someone to bring this up since the change in regs. Yes, the public record speaks for it's self, one simply has to understand what it is saying.

If you look, you will see that the date you quote is a second change since that time. Go to the FCC database and check the progression.

Why should I cast aspersions toward you, I leave those tactics to those that have no rational arguments. If you have any doubts about my qualifications, you need only ask and I will be glad to point you in the right direction. This will save you from making invalid conclusions.

I'll make it easy for you to find, Paul: Among my letters to ARRL include
my newsletters sent to the division membership during all my runs for director
(that's an ARRL rule). Easy to locate, all in public forum. One of them
especially went into detailed discussion about what to do to protect/improve
the Service re: deregulation. They will also have my 300-word statements (as
part of the ARRL mailouts) on file. They will also have on file two letters
concerning my proposal to initiate the (first) Spectrum Protection Act (which
they allowed me credit for on at least one of my 300-word statements).

Other information you ask for is of a technical-article nature: October
1972, March 1974, and January 1977 QST (that one a Cover Plaque).

If ARRL has none of these, a summary of all those suggestions to improve
the exam process per se was filed with FCC in their restructuring proposal.
On the FCC site, in public forum. In only 4 pages, as I remember.

Just to keep you knowledgeable, my runs for director were based on
what was possible for the voter, not impossible. Far from your
'dictatorial' label, my platform specifically pushed binding referenda
in the Hudson Division: a no-nonsense binding vote by membership
to be held on the most important (major) issues that the director would
be bound to in his vote on the Board. One or more of my opponents
spent time racing about the division with the message that it couldn't
be done, and/or it wouldn't be good. The 'binding referenda' idea
made them nervous. In that context, there's also a letter on file to an
ARRL reform committee re: nasty politics that came about at my
expense during my run to push binding referenda.

During the course of my "runs" (two of them three-man races, two of them two-man races) my message evoked three major responses:

1. You won't really bring binding referenda, will you!
2. Your message about binding referenda is scaring a lot of people.
3. You come on as too honest, thus we're confused.

Comment (1) told me that someone was trying very hard to convince them I wouldn't do what I promised, or that the voters were looking for a way out when faced with a solution to their supposed 'we're never heard' problem.

Comment (2) confirmed that people complain about not having say, but if given say, they'd run. Comment (3) pleased me greatly, because it told me that, by definition, I wasn't a politician. Comment (3) said clearly that voters indeed _expect_ bull in a politician: that is, they expect a lot of nonsense.

One 80+ year old ham told me back then "Vince, people don't want solutions, they say they want control but they just want to hear themselves complain. They want to be kicked in the *** so hard that they cry. Believe me, son, that's what they really want."

I believe him, now. The business about voters wanting to discuss the "issues" is hoary nonsense. They generally don't. They want someone to tell them what they want to hear, then lead them by the hand, then complain about it later that they have no say, just so that they have something to complain about.

In that context, I learned a lot about what a good politician does. And a lot about the 'herd' instinct in humans. Happily, too, I learned I'm not a politician because I refused to enter the world of double-speak. I talked issues, my opponent(s) danced around them and talked about nothing, actually. Which is, interestingly enough, why I don't hold politicians in high regard. The best politicians are rather like circus and magic people, when you come down to it: now you see it, now you don't. They're actually into entertainment.

Sleep well, Paul.

Regards,
Vince, WB2EZG

Brings up an interesting point Ed, how many folks operate spread spectrum Morse? Does anyone in fact do this? (serious question)

Why the construction requirement? Do I need to build a computer for the PSK31 as well?

I will concede that someone who has the ability to construct a spread spectrum transceiver is superior to me in that respect.

Back when my eyes were good and my hands were steady the smallest active element I had to deal with was a 6AQ5, now I can barely see a surface mounted component, let alone solder the dam thing.

Strange, I didn't hear KC8JBO, just a bunch of identifieds. Riley can't do much with the unidentifieds.

He needs to be off the air like WB2OTK and some of the others.

What others?? The people who were thought to be the " Biggest " troublemakers are gone, examples: KV4FZ, KT4TR, W4FQF, W4LLI, K4OKA, K4VVV (Little Richard drunken disc jockey), gone from 14.313, but the qrm'ing continues. Rich WB2OTK wasn't/isn't the problem. The problem is the inability of the FCC (and, this isn't Riley's problem) to fund people to track them down.

It's doubtful if any " official notices will come out of this. Most of the rhetoric has been from NG's and newbies.

Of course it does, same as it makes me better at that skill than one who has never figured an exposure problem.

Ed, the demonization of someone being superior is a product of the feel good generation. Soccer games for kids that do not keep score ,so no one feels bad. Gradeless classes for the same reason. One could go on forever listing the esteem building exercises.

The reason you see such vitriolic response, is for many this is the first time in their life they have been told they don't measure up. Do you not sense the "it's my God given right to be equal in all respects regardless of effort" attitude in the responses?

I exist, therefore I deserve... (stolen from another post)

Does a superior skill make be better than someone else in the grand scheme of things? Nope! But the interpretation today is if you claim a superiority in any field, you are doing it to "hurt the feelings" of those that don't have the skill.

I personally don't give a red rat's hindparts if anyone ever learns or uses CW, I do care that they find it offensive that someone else has acquired the skill and that the longest threads on the newsgroup are the apologists for the code challenged.

Enjoy what ever privileges they may have and knock off the nonsense, until then I shall enjoy demonstrating the absurd with absurdity.

Hopefully, "DX405" will get a better job so he can afford something
other than CHEAP-ASS RADIO SHACK RADIOS.
But cheap is as cheap does......

If anyone has doubts about my qualifications wrt CW, they can meet me on 40 M and judge for themselves. That will be a better indicator than the code speed of the test I took in 1976.

I don't think anyone would take any objection at all to a statement that you are superior in a particular field. Let me try it:

I can copy 45 wpm in my head and 25 wpm on paper, so I am a superior CW operator to those who cannot. -- Ed

What they would object to is a statement they believe implies that such as skill makes me superior to them, without any mention of what field. My superior CW skills may indeed make me a superior ham, unless that non-coded op has an even greater accomplishment somewhere else that overshadows mine. And, I will add, that I do NOT believe that my CW copying skills are the greatest accomplishment I have in ham radio. Nor do I believe that my own accomplishments put me at the top of the "superiority" heap; there are others who have, IMHO, done more for ham radio than I have.

I don't find it offensive that you have aquired CW skills, nor do I find it offensive that others have not.

Although I agree that it is important to keep score in a soccer game, I do not believe that it is necessary to keep score in everything in life. Maybe this would all make more sense to you if you viewed it as personal accomplishment instead of another game of who-tops-who. I judge my own accomplishments only by my own standards. I do not need to hold them up to anyone else's accomplishments to feel that I have done something worthwhile.

If we are going to have a wager that is analogous to the requirement to manually decode Morse code, I think the manual requirements of construction are an important part of the analogy.

> I will concede that someone who has the ability to construct a spread
> spectrum transceiver is superior to me in that respect.

Yes, just like your ability to receive Morse code fast makes you superior to him in that respect.

Just remember, there are about 650,000 of us, and if we are all assigned a superiority rank, only one of us will be #1. The rest of us are all probably somewhere well down the list.

> Back when my eyes were good and my hands were steady the smallest active

Fortunately, you can look at a lifetime of accomplishments and not have to rely on any single of one of them for a sense of self worth. Maybe that applies to all of us.

I think the biggest issue here is that some think of SS as a 'digital' mode.
The most common application for SS is for voice communications.

> One amateur band somewhere in the spectrum would be
> ideal for DSSS or FHSS trials. I would think it woud be

I think that 2.4 GHz would probably be the best first choice. There is
certainly a lot of equipment coming available for that frequency range.

Or different characteristics and not hearing each other. :-)

Maybe the Bluetooth spec would be a reasonable starting place. Start with
the chipsets or steal the board out of the first low-cost device to have a
Bluetooth board in it.

Why would you consider it fantastic memorization that to this day, I still remember that I didn't have a clue about the question about the impedance of open wire line, or that I didn't know what a parasitic oscillation was, but knew it had some effect on interference, so I guess right. A memory that can't hold onto such generalizations is a pretty poor one.

Does that explain why they invested the hundreds of staff hours that restructuring took and have stepped up amateur enforcement?

Do you believe that it should be illegal for people to talk about the content of the tests after they have taken them? Do you believe it should be illegal to print information about the content of the tests after they have been taken?

Do explain how the Bill of Rights fits in with your answer.

FB. Let's save that for later...

> I didn't get my ham ticket for the singular purpose of being able to
empower myself
> by projecting my voice over long distances at the press of a button.

From what I have read of your posts, you think everyone else gets their
licenses only so they can project their vioces over long distances at the
press of a button.

> Moreover, having had that capability for my entire career ham career, I've
always sought,
> and utilized, more challenging modes.

But no one else does?

> I consider myself to be well-qualified to hold the highest, most
> distinctive class of license.

I believe that you are well qualified, and more. But you didn't get all of
that qualification solely as a result of studying for your tests, it comes
from years of being a ham and:

> I became a ham after years as an electronics hobbyist, and passed my
> written tests largely on the basis of knowledge I had acquired over
> that time -- through self-study from a variety of sources, and
> hands-on experience in project building.

> I've had nothing handed over to me on a silver platter;

Sure you did, at least as far a licensing is concerned, you took a test that
was much more simple than the level of knowledge you possess right now.

> becoming a ham meant enough to me to learn the practical communications
> skill which is Morse/CW.

You are correct; being a ham means enough to people that they will learn.
That is why they want to be hams.

>Does that explain why they invested the hundreds of staff hours
>that restructuring took and have stepped up amateur enforcement?

Yes, fully. Personally, I truly believe it was timed with
"Amateur" restructuring to move hams down from VHF to HF,
and geared to show newbies to the HF bands that HF was a
hospitable place to live. That's my opinion, and I'll stay by it.
Knowing the history of the deregulation issue, I believe it's a
fully logical conclusion.

Would you advocate that the rules be written to require all amateurs to possess the skills *and* equipment to operate any particular mode or lose their license? That would be a better way of ensuring that they met that goal.

> That remark is inconsistant with reality and you know it.

Yes, I do know it. But it is exactly analogous to the belief that an applicant must demonstrate proficiency in Morse code before being allowed to try the mode on HF. People would learn the mode, or write some really cool software, before trying it, would they not?

Not to my knowledge, Fred. While one could do FH or DSSS with Morse encoding, on-off-keying would be a pretty bad choice for SS. One could use one of the FSK or PSK modes with Morse encoding, but it would not be optimum, either.

Of course, not all amateur radio needs to be optimum to be fun. Perhaps a simple BPSK signal, with Morse encoding, could be frequency hopped successfully.

The big bummer here for me is that I have far more dreams that time; I think that RFI and related spectrum issues for ARRL will probably represent the majority of my accomplishments for a while. Of course, I do have this Hare-brained idea for a 2X QRP EME QSO. :-)

Why would you equate passing an upgrade with name calling, Richard? Whether upgraded on April 14 or April 16, those who upgrade have done no more wrong than to do what the law requires to get a particular type of license.

If someone wants to upgrade after April 15, what tests are they going to be given an opportunity to take?

Well, I am not better than everyone else. I may be better than some, in some things, and I suppose that if any of were really given the authority to tally up the score, I might even be better than some overall, but others would blow me away. I much prefer that I not be judged at all; just let me be a ham who operates as required by Part 97.

I did attend a midnight session of the Royal Order of the Wouff Hong. Does that count for anything?

Although I am sure that some of our members prize manual code speed over nearly anything else, but let's take a little poll right here. Of those that are ARRL members, how many of you would like to see an article that describes how to use software to reliably read Morse code in the presence of noise and poor timing?

Count me as vote #1 for yes. I pony up my dues every few years.

> If growth isn't one of "our major problems," what do you think they
> are? And how will a zero-WPM, one-class license fix them?

First, let me be clear that I do not believe we should have a one-class license system. Though I believe that not grandfathering existing licencees when incentive licensing was put into effect was a mistake, I think that the premise of incentive licensing is appropriate.

The biggest problem I think we face, Larry, is one of spectrum. That will be solved as much by useage of the bands as it will anything else. Let me turn the question around and ask you how having a multi-WPM test series will solve that problem?

Another problem is that we are not seen as being relevant by many in industry and at the FCC. How will having a multi-WPM test series solve that problem? IMHO, this is the most important reason to replace the Morse code tests with tests relating to newer technology.

When the no-code VHF license was introduced, there was a sudden influx of newcomers for which there simply was not sufficient Elmering. How will having a multi-speed code test series solve that problem.

I see the petty bickering that is taking place here and elsewhere and the sour grapes and/or gloating as being harmful to the amateur radio service. How wil having a multi-speed code test series solve that problem.

What problems do you think are facing the Amateur Radio Service and how do you think having a multi-speed code-test series will solve them?

That's because they want to be accepted into ham radio and obsolete hams thinking obsolete thoughts won't accept them. The thing that defines a ham is a ham license. If you don't believe it, ask the FCC. I have all amateur privileges. It matters not a whit that my palsy and arthritis prohibits me from sending 20wpm anymore.

> fully logical conclusion.

In this logical conclusion, are there now fewer VHF-only licencees than there were before the FCC took the sneaky back door approach you believe they did? If so, cite the source. If not, explain why it backfired.

Why do you think that the FCC didn't simply reallocate spectrum if they felt that they didn't want us there? The real action is above 1.2 GHz (higher frequencies generally mean that spectrum can be resused every few miles, so it is quite useful nowadays to be high up). Do you believe that restructuring is going to have a significant impact on amateur occupation above 1.2 GHz? What do you think that effect will be?

Thanks Dean, for the off topic posting. Nothing you said has anything to do
with the code requirement. It is not political correctness, it is progress.
The old guidelines are obsolete. Common ground cannot last forever. If it did,
we would all have to ride a horse before taking a driver's exam. Equal access
to public property is guaranteed by The Constitution. Pride is not a requirement.
Outmoded rituals are not a requirement. The simple fact is that the Morse code
requirement is obsolete in the 21st century. The rest of the services realize
it and it is an albatross around the neck of the Amateur Radio Service.

Sure, Ed will speak for himself. I first wandered across 14.313 about 5 years ago, out of curiosity. It was bad enough that I didn't go back for years. A few months ago, I listened to 14.313 and heard -- a maritime net. Glad it was better, but I haven't listened since.

Is there a specific reason I should? I don't operate much SSB. My Omni D does tune 14.313. Once in a while, I go all the way up to the county hunters net on 14.336. More often find me on 14.060 (QRP) or 14.0565 (the CW county hunters hangout).

> asked on any actual exam you ever took. I never saw that
> question on even my Novice exam.

It was definately prominently featured in the study guide for the Novice exam I took. I really don't remember much about the Novice exam, but I am sure it appeared on at least one version of the Novice test.

I was absolutely astounded at how easy those 4 pages of study guide for the 1963 Novice exam really were. All of the questions I thought I remembered about feed lines and antennas and propagation weren't there at all. Frequencies, power levels, a few rules and Ohm's law just about covered it.

> it's time for hams taking those exams to start complaining
> about dumbing down.

I scanned the 4 pages; I think I have them at home. I will have to post them, if I remember to email them here. Maybe we should make the entry-level exams hard again so that new hams have to study 4 pages to get them.

Cecil:

What if a situation arose where people's lives depended on
communicating with the outside world, and the only mode that
would work was some form of Morse/CW? Ever hear of a
fractured larynx? What if the only HF transceiver available
had a choice between SSB or CW, and there was only a single
gel cell battery to power it? How long could it transmit on QRP
CW as opposed to SSB at 100 watts?

The problem with the Morse/CW mode is that in order to
effectively exploit its practical advantages, one needs to know
the Morse code! Can you at least agree to that?

Obviously, he wants to be a big man among the slouchers in his club. Being supportive of continued code testing is a highly unpopular political position; it requires anyone who holds it to take a lot of anger from the slouchers -- something I've lived with for years. Bill obviously doesn't "need" that kind of grief. I don't either, but I get it anyway, because I am not afraid to express my opinions clearly and with conviction. Bill goes with the flow, and gets to enjoy the good will of his fellow hams. I go against the grain, and get hatred and regular back-stabbings. I can very well understand why a person who desired a normal social life among his fellow amateurs would take Bill's position. After all, being "politically correct" is a high priority among hams these days.

Ed:

I'll look forward to reading it. Please send me a copy via E-mail, since I don't usually bother reading the newsgripe during the work week, since I'm usually never home before 7 PM and usually have to be out of bed again by 4 AM.

>I cannot answer the second because I do not believe that we should have a
>one-class license system.

Please consider that what you believe we should have, and what we end up with, are likely to be two different things. I can easily see all ham radio privileges given away with a single multiple-choice "written" test. It would be the ARRL's last desperate attempt to entice people to join up, considering the abject failure of Restructuring so far.

>I also do not believe that our licensing system
>should contain no Morse code testing. I believe that Morse code proficiency
>should be tested the same way we test for proficiency in other modes.

I see. So asking multiple-guess questions *about* Morse code operation is now the equivalent of actually testing people on the skill of sending/receiving Morse code texts? That is nothing but more dumbing down; more pandering to the lowest common denominator. You forgot to tell us how this is going to lead to high-speed, high-throughput digital communications magic being performed on the HF airwaves -- or how it is going to drag thousands of young people away from their Web browsers, DVD players, and Sony Playstations! Oh well, give it a try, anyway -- I don't think anything like the opinions of current, pre-April 15, 2000 code tested hams is going to stop you!

Brian Kelly <kelly@dvol.com> wrote:

> Just DO it, it's your lab right? Oh, never mind . . !

The Lab testing is under my control and I try to make sure that equipment is tested within a few days of its arrival. Usually, a rig like that will spend about 5-8 days in the screen room, being tested thoroughly from DC to daylight.

Sometimes, a key accessory, like a filter, may be on back order, so that can delay the process. From there, the radios go to a reviewer, or, more likely, several reviewers. That is the part that is NOT under my control, even if the reviewer happens to be a Lab guy. The reviewers are contract authors, paid the standard page rates. (Policy is that staff, officers or Technical Advisors can do reviews.)

The test results, btw, are summarized in the test-result table in the review, and for most rigs into an expanded test-result report. I put a sample up at http://www.arrl.org/tis/info/pdf/k2.pdf, if you want a quick link. (This is on the public site.)

Larry, are you a split personality? Last thing you said about the
subject is that the 5wpm requirement might as well be done away
with. That's what Bill is advocating. Both of you guys agree that
there's no longer a good reason to have a 5wpm requirement.

Don't know. The only thing reported was that the question got asked. I
think I heard it on the Ollie North show out of a Rolla MO fm station.

In Ohio, we know what that answer is in relation to our National Guard.

>door approach you believe they did? If so, cite the source. If
>not, explain why it backfired.

Where does logic say the number of VHF licensees at this second directly relate to FCC's initial move to restructure and deregulate? Where are the comments that say the FCC "took a sneaky back door" approach? As John Madden would say, FCC's actions were "smash mouth, in your face football." Go back in Dejanews as far as you want: my comments have always been that deregulation was a done deal from the start. I don't know what you think you're doing, son, but it ain't getting done.

You seemed to have missed the point entirely, Larry. I was talking about CW. In the present amateur radio environment, if it's not fun, it's not practical. There is no other incentive for a ham to know Morse code anymore except for the fun involved. If you want to recruit new hams to Morse code, I would suggest you stop telling everyone what a pain in the arse it was for you.

There's absolutely no reason to require the skill if the equipment is
not also required. How can one use CW for emergencies without any
equipment?

The arguments are different. Jim says there is not one code-tested jammer
using Morse code equipment. I say there is at least one and probably more.

Vince's statement is an if-then statement which is, of course, false
since no test is perfect.

Yes, we know that Ed.that was then.This is now. BIG difference. Once
it was all hams, until some entrepreneur saw a buck to be made filling a
commercial need. Now it's nearly all commercial, with hams hanging on by
the skin of their chins.

>

Total nonsense, and I know that you know better than that, so how can I
NOT believe you are exerecising an Agenda? You know as well as I that it
is simply impossible to operate CW without a minimum level of training
and practice. Those who want to operate CW must undergo that training.
Anyone who just hooks up a key or a paddle to his rig with the builtin
keyer will fail right out of the gate and you know it as well as I. How
can you at ARRL NOT to be merely trying to grease the skids for the
demise of the mode?

>

> Do you think the same thing was said about the use of spark in the Amateur
> Radio Service?

No I do not. Spark covered a wide area of spectrum with a single
signal, and spectral efficiency alone mandated its abandonbment once
better technology was widely available. Now you'regoint to tell me we
have that sort of spectrum crowding problem today. And I'll send you to
scan the 70 cm band and report back.

> Do you think the Amateur Radio Service would have survived had
> it not evolved past that?
>
> > and some use no other mode, nor wish

So you've joined all the anti CW goons in slamming CW supportgers as
Luddites then? No one has EVER said anything about the ARS not evolving
and updating.
This entire squabble has been and continues to be really simple although
you and many others who really want CW totally dropped from testing
continually make it something it is not and never was. It is NOT an
anti-technology fight, as you seem intent on insisting. It IS
anti-laziness campaign. I believe that any worthwhile ham will agree to
learn CW so at to be able to use it, and I also believe that it should
be required of him/her to do so. A duty. Aw, that nasty word again. The
advance of technology and the evolution of the ARS has not a thing to do
with it.

If it quacks like a quack (false duck) it must be Cecil.

Who in the world is dumb enough to actually believe he can jam anyone with dits and dahs? You're just arguing to hear the wind blow, still. The jammers who actually jam use noise generators or steady carriers wobbulated to defeat your notch filter. They're not dummies, just idiots.

Jim is right,of couorse. You just don't hear that nonsense on CW. And you don't read about CW operators getting NAL's.

Sure. Use K0HB for the noise, and W0EX for poor timing or just use him for both the noise and the bad timing. That ought to be a real test for any software.

Seriously, it would be nice to see some side by sides of software/hardware performance competitions from the pk, kam, universal, etc., as well as the cheapie baypac type.

QST has been doing well with the nec antenna modeling software, and I think it was World Radio that did the VOA Prop software. Both are outstanding directions for the future of the ARS. Keep up the good work.

While I'm dreaming, how about a how-to article for an ionospheric pinger that measures the critical frequency? A network of these might be as useful as the 20M beacon network. Too bad we would be out of band about 90% of the time.

Ed, how long are you going to keep up this charade? I knows it's not politically correct these days to reveal the fact that working CW does indeed require a bit more personal involvement than any of the other- read 'easy'- modes, the ones for which one needs basically only to RTFM. But it is no less true. Does you sense of what is true and proper not get just a little uncomfortable as time goes by and you find yourself deeply involved in propping up a total charade? For that's what it is. You'd have just as much success taking off and landing an airplane without prior training and practice as you would successfully making a CW contact on the air without the necessary training and practice. And I'm sure that you know it.

Don't overlook the big point-again. Fred can easily operate those
modes. Nocoders cannot easily operate CW. It takes a little personal
involvement and dedication to skillhuilding.

It certainly is. Neither activity can be accomplished without
sufficient training and practice such that one can properly perform the
necessary functions to successfully complete the task. Some things
cannot be accomplished by "winging" it.
```

Not so. Jim said USING MORSE CODE, not equipment that can be used for Morse code. In that case any radio capable of being keyed as a CW transmitter would qualify.

If you like propagation, go to http://elbert.its.bldrdoc.gov/hf.html and download the HFWIN software. This is about the coolest freeware I think I have ever used! It will give IONCAP predictions, from city to city, complete with either frequency vs time graphs or world maps of signal contours. I promise it is worth the price!

Dick, you forgot the smiley.

I learned CW in 1963, from a chart and by saying dit-dah in my head a lot. W1BNB sent code at 5 wpm and I copied it. I got my Novice. When I made that first shaky CQ, I do not believe that I had anything more than this self training, and absolutely zero practice.

Do you really believe that if W1BNB had not checked my code speed at 5 wpm, that I would not have been able to get on the air and do my first shaky QSO? I would not have done so until I knew the code.

Would you ever sing a song in front of a large group of people unless you knew the words?

Do you really equate my learning code at a shaky 5 wpm and making a QSO that I wasn't really ready for with flying a plane?

Of course, learning CW can be accomplished by "winging" it since there is no punishment for doing so. The reason that one cannot "wing" learning to fly an airplane is because one winds up dead. The only thing that happens to a poor CW operator is that the other operator pulls out or the QSO cannot be finished. It's no big deal if a QSO cannot be completed. It happens all the time because of fading MUFs.

The only CW-only bands in the entire amateur radio spectrum don't require Morse code for the license. That proves that the FCC thinks CW can be learned and accomplished by "winging" it. Why should HF have any different requirement from the CW-only bands?????

If one applied your desired rules to speech, babies would never be allowed to try to speak until they were fluent. Is that really what you want?

Now, if all of these new hams can memorize over 1,100 questions in the question pool in a weekend of studying, I am sure they can memorize 26 characters and a few punctuations "easily."

I do agree, though, those who don't know Morse code can't easily use the mode. They would have to buy a TNC and read the manual. :-)

I am curious, what can Fred to easily operate spread spectrum?

And many are like the message I am enclosing copied from Rec.Radio.CB, I forward sans comments:

I have to agree with you there ken. I am a Ham operator with a tech no code license. I like DX, that is the main reason I use radio. Right now I can talk useless (to me) Vhf now but no HF unless I use 11 meters. So about the only DX IM doing is freebanding until I suffer through these tapes and learn this stupid code. I can already pass the General exam and I'm studying for the Extra, but all my DX is on 11 meters.

Plus when I go out 4wheel driving and want to keep in touch with my XYL (wife)if I use regular CB it is to crowded, and she dosn't have a ham license so what freqs do I use??? You guessed it, I go above channel 40 on 11 meters. I don't bother anyone and I have safe comm with the XYL.

The main thing about freebanding is to use courteous operating procedures, good equipment, a Low-pass filter, grounded gear and not to much power.

That's not true. I dismiss anything that is irrelevant to the
argument. Music is not listed in the list of languages in the
encyclopedia. Neither is Morse code. Just because you want to
confound the language is no good reason to allow you to get
away with it.

Let alone the fact that on/off keying is not Morse. A string of dots or dashes at 60 WPM from a built in keyer does not a Morse operator make.

No. I believe that the test should contain a sent Morse code transmission and that the applicant should be asked questions about it. The way it would be tested the same as other modes is by including the answers as part of the overall score. 75% passes.

> worse)...

I will take that bet. Let's take the first 100 CW QSOs from the 2001 W1AW logs from those operators whose age can be identified from the birth dates at the QRZ site or ARRL membership records as being either between 50 and 75 years of age or between 15 and 40 (inclusive). At 20:1, that would mean that 95 of the operators on the other end are 50-75 5 15-40.

Steak or lobster? :-)

Why would I want to end the mode that I use 99% of the time? Do you really believe that I am not posting what I personally believe?

> Now you'regoint to tell me we have that sort of spectrum crowding problem today. And I'll send you to

> scan the 70 cm band and report back.

Why would I want to tell you that, Dick. I have said a number of times that our occupancy of the higher bands is low. Did you miss the posts?

> So you've joined all the anti CW goons in slamming CW supportgers as
> Luddites then? No one has EVER said anything about the ARS not evolving
> and updating.

> It IS an anti-laziness campaign.

The difficulty of the present entry-level tests are already much much harder than they were when I studied those 4 pages to be a Novice. How can you say it is a laziness issue?

> The advance of technology and the evolution of the ARS has not a thing to
do
> with it.

We agree.

> Your reserve supply of arguments is clearly gone when you have to

All BS aside, I can appreciate SS for military or commercial communications. As a ham mode, one would first have to make a standard contact, then agree on the spreading code and then switch to the mode. I admit ignorance as to how SS is being used on the ham bands, is there a standard spreading code and base frequency? While I may be in a self imposed minority, I can't see the utility of the mode for normal Amateur operations.

If one were setting up a traffic circuit or internet via amateur radio it would start to make more sense. That would raise another point as to how one could use the internet over amateur radio, given the bent towards the profane, and posting by people from countries without a third party agreement. What am I missing? Given a reasonable use, I would be glad to dig into it and at least learn on a rudimentary level.

PSK31 is a mode I might find tempting if I didn't live on 30 acres with no antenna restriction, and my nearest neighbor almost 1/2 mile away.

Dang Dick, you are the next Yogi Berra. Talk about mixed metaphores.

> You know as well as I that it
> is simply impossible to operate CW without a minimum level of training
> and practice.

But the question is: Why can't that training and practice take place
on the air? One wonders why you want to keep the airways all to yourself.
Did you refuse to allow your children to talk until they had mastered
the English language?

> So you've joined all the anti CW goons in slamming CW supportgers as
> Luddites then?

You are NOT a CW supporter, Dick. You have discouraged more potential
hams from ever trying CW than anyone else I know.

> It IS anti-laziness campaign.

It is an "I had to do it so you have to too" campaign. What is wrong with
live and let live? Why should everyone be forced to learn your personal
favorite mode?

VB>I'll make it easy for you to find, Paul: Among my letters to ARRL include
VB>my newsletters sent to the division membership during all my runs for director
VB>(that's an ARRL rule). Easy to locate, all in public forum. One of them
VB>especially went into detailed discussion about what to do to protect/improve
VB>the Service re: deregulation. They will also have my 300-word statements (as
VB>part of the ARRL mailouts) on file. They will also have on file two letters
VB>concerning my proposal to initiate the (first) Spectrum Protection Act (which
VB>they allowed me credit for on at least one of my 300-word statements).

>Are you saying that all of these important documents only have copies at
>League HQ, that is, if they were retained by them at all? Since the
>League is an organization you have much disagreement with, I'd expect
>that you'd keep personal copies of this important correspondence about
>examination reform, spectrum protection, ARRL electoral politics
>including "dirty pool" by other participants/supporters, etc., in case
>there is any disagreement about content.

First, the documents are not important at all. What I am saying is get your
proof of their existence from ARRL, since you could always say I've just
generated any letters I might give you and what I say is not true (which
is what you've long attempted to show in any case). Arguments with
the League aside, ARRL would not be so foolish as to doctor a public
record.

>By asking the TIS for everything, I was inquiring if there were letters
>to the editor, or other small items not in the public indexes (their
>internal indexes, or even institutional memory such as experienced
>staffers, might be more detailed than the indexes at www.arrl.org, or in
>the December QST's each year).

There was one letter to the editor c. 1969 regarding the Extra Class exam.
A lot of correspondence to ARRL staffers such as Doug DeMaw, Lew
McCoy. Mostly technical exchanges, some political ones.

VB>If ARRL has none of these, a summary of all those suggestions to improve
VB>the exam process per se was filed with FCC in their restructuring proposal.
VB>On the FCC site, in public forum. In only 4 pages, as I remember.

>Be assured that that was read by me very shortly after it was made.

Make sure then that ARRL gives you a copy of that document. I sent
them one.

There have been other letters sent to HQ hierarchy over the years,
starting c. 1964 with George Grammer, then various presidents
in office, and Dave Sumner. The vast bulk of them, tho, are political,
starting in the mid 80s, then picking up again in the mid 90s with the

ARRL poll written by ARRL's First VP and I believe the GM and possibly ARRL president. A poll so badly done it drew slashing criticism from even one ham who was a social scientist (K4JAP) in the business of designing polls. The response was so incendiary, Dave Sumner initially denied even receiving some of those letters. All the ARRL had to do was hire a professional polling firm to construct the survey. But no, they had to do it their way.

They received a letter from me on that, warning of the consequences of doing a poll written by amateurs. AND they received a letter from me afterwards, but by that time K4JAP had actually beaten me to the punch; instead of providing his own professional critique on the poll, he referenced my letter! (Still ARRL couldn't get its no-code/slow-code thing through.)

But I digress. One of my exchanges with the Pres, in speaking about the poll, also went through in detail what was happening to the theory exam process, and what specifically needed to be done to fix it.

SO MAKE VERY SURE you receive a copy of THAT letter from the ARRL archives. If you don't get it, they've either trashed all that correspondence, or they're not giving you all they have. Time to get down to the nitty-gritty on this one. But ARRL will do the proving for me, just to demonstrate I've been involved in this thing for 18 years in no-nonsense fashion.

If they obey the rules within the ham bands, who cares where they
came from? If they are operating legally as hams within the ham bands,
they aren't freebanders anymore, are they? Seems ham radio has saved
them from a life of crime. Seems that is a good thing to me. Do you
disagree? Do you condemn anyone who has not lead a perfect life like
you have?

Whose mind, NCI, FISTS or ARRL. I am sure that the basic agenda of NCI and FISTS is pretty well set, but just how both organizations will undertake their basic missions will, IMHO, be influenced by member input.

I will also tell you that I don't believe that ARRL's mind is made up on this issue. If it were, the Board would not have seen any need to publicize the agenda item well in advance. Frankly, I wish the Board would do more of that, whenever they can.

I know that the last time I talked to Tom, he had not received very many member inputs on the topic to be discussed and possibly voted on at the January meeting. I am sure your Director is in the same boat.

See http://www.arrl.org/divisions.

SS is probably not well suited to "random" QSOs, as are the narrowband
modes, although an SS repeater is very much a possibility. In that case, the
spreading code or hop sequency would be used the same as frequency.

Unfortunately, SS is not at all in significant use in the ham bands. For a
rundown of the current useage, see http://www.tapr.org.

I don't think he is comparing the severity of the failure to accomplish the task, simply that the two compare in ability to complete the task.

And just how have you made that determination.
I've seen no lessening of VHF use here in NJ.

That's petty well how it happened, along with the caveat that it gave
FCC a
very easy out of the problematical Medical Code Waiver dilemna. Riley
himself made the comment on how a "few people can change the world-they
just did" WRT the restructuring.

I think the study guide will let people decide for themselves, Vince. It was, after all, derived from the FCC-published syllabus. For the Novice exam, things were kept pretty simple, so they stuck to the syllabus pretty closely.

If you feel the best way to persuade people to make up their minds your way is to remind them that I don't deserve a Nobel prize in Literature, I won't mind.

For almost everyone it IS a real pain in the arse! Why are so many
easy accessers so opposed to it? Not just because "we never plan on
using it".
No one planned onusing it beyond the time the phonelicnese arrived. Most
of us found the benefits and value of it only after putting up with the
pain until we passed that point. When one approaches it from a "I don't
want to and I shouldn't have to" angle it makes it much harder to to
than if one takes it on as a task to be accomplished.

Dick, if you keep that up nobody in the world will want to learn it.
For me, Morse code was fun. My cousin and I learned it without any
rewards. It was trivially easy to learn. It is so trivially easy
to learn that a Morse code requirement just doesn't make any sense.

> of jamming. The answer is obvious.

Again,Cecil has twisted the subject to fit his own Agenda. What Jim said was that NO NAL's were ever issued to any operator for operation using Morse code.
Then Cecil not so subtly changed the entire situation to a "using Morse code equipment" theme, contrary to the original. He ignores of course that any ham radio transciever is capable of Morse code. And as Fred says, keying a key or keyer to cause an RF carrier doesn't make Morse code. Any Freebander who has no ham license but does have a ham tranceiver for his bootlegging operations can have all the CW sending gear he wants,and many are said to have it. The one jammer case that I personally know of was not a licensed ham at all, but he jammed with a carrier and audio.

It is simply NOT TRUE that the tests emphasize one mode over all
others. Morse code is simply not subject to testing that does not
include the ability to function as an operator using that mode.That is
no different than it has been for a hundred years. All assertions
otherwise are smoke and chaff.

What I can't believe is that you really truly believe that any
significant number of todays hams will ever learn it if they don't do it
for a test. It just doesn't compute based on history.

You really don't want to read all that again, factual as it is.

It is very easy to believe that the wheels at ARRL are resigned to an
ARS of any kind, at whatever level FCC decides to drop it to, in the
desperate hope that it will be able to remain in existance at all.

Ed, having just admitted you don't remember what was on your Novice exam, you know not of what you speak (in my opinion; no offense). On the other hand, I for a fact remember that question wasn't there. And the reason I remember it is that I specifically remember saying to myself "even the Novice exam wouldn't be so trivial as for them to ask me what the unit of resistance is. The test is a giveaway as it is!" The only break I could possibly cut you is that some exams had that question, by chance. But I've yet to run into one that specifically remembers it. Just too easy. Ridiculous, in fact.

How you can delude yourself and attempt to delude others is beyond belief. One exam is for Morse code. One exam is for everything else in ham radio combined. If one flunks either exam, one doesn't pass. Therefore, the Morse code test is EQUAL to everything else in amateur radio combined. Each exam is pass/fail. Exactly what is it about this situation that you don't understand?

> What I can't believe is that you really truly believe that any
> significant number of todays hams will ever learn it if they don't do it
> for a test.

What I cannot believe is that you believe in a tyranny of testing where one mode is considered as important as everything else in ham radio combined. Where is your sense of justice and fairness?

So exactly what is wrong with CBers and freebanders who enter the
ARS and obey the rules? Aren't you, in essence, advocating a sort
of racism? Black = 0wpm. White = 20wpm. Hispanic = 5wpm. Asian = 13wpm.
Blacks don't deserve equal rights.

Ten years from now, if there is still an ARS, the only class in existance will be Extra. When FCC drops all the other classes they won't dare off end or insult anyone by renaming their license, so they'll have to make every licensee an Extra. Whatta concept- the no code, no theory Extra!
That's what they started on April 15. I doubt it'll take ten years to complete the job.

Replay #976.... They don't memorize the questions and answers, they
make word associations so that when they read a question they look for
the familiar choice among the possibles, and can pick it out often
enough to pass. That's after studying only a single test element, not
the whole question pool. Vast difference, but you already knew that.

Ah,but you DID have training and W1BNB sent you some code practice.
Enough to get you started. Do you equate all that to a couple written
questions on a written exam?

> Do you really believe that if W1BNB had not checked my code speed at 5 wpm,
> that I would not have been able to get on the air and do my first shaky QSO?

Do you really believe that no ham who had never had that Novice style
training and bit of practice would get on the air and give it a go
anyway, with a lookup chart, at .00001 WPM?

> Would you ever sing a song in front of a large group of people unless you

I can't carry one (tune) in bushel basket.

>
> Do you really equate my learning code at a shaky 5 wpm and making a QSO that
> I wasn't really ready for with flying a plane?

Well, my first solo was no masterpiece either, but I did make it back.
The second time around was better. On the third, full of newfound
confidence, I let it get a little slow just before touchdown and the
Cessna 150 stalled -quit flying- at about three feet off the ground. It
fell the rest of the way with a thud, bounced and bucked like a wild
bronco, and I got the world record for a short rollout, no more than 50
to 75 feet. I didn't know it, but the stall warning indicator wasn't

working.
My instructor, who was watching the whole affair from a runwasy marker nearby, made me get back in and take it around again, just for grins and to regain my aplomb. I never again let one get too slow on final.
That lesson was worth a lot of hours of ordinary flying. The lesson was that you never "have it made" till the machine is parked and tied down, and you never assume anything.

You're too dense to be surprised. Just because I've known personally
only one jamming case that comes immediately to mind, that means I have
no knowledge of any other? I can't read my monthly QST like you do? I
guess you've been "personally involved" in dozens of jammng cases and
that makes you an expert?

Oh,I hear jamming on a weekend net every week. But we just ignore the idiot and he takes his No Code arse somewhere else to try to gain his "revenge".

Weapons are not permitted on the steps of the Capitol. You could get
arrested! An even better place to take the guns would be to Andrews Air
Force base. Lots of things to shoot at there, and a great opportunity to
size up the opposition.

And if the requirement for Extra had been 1B, you would never have been able to work any faster than 13 WPM? I'm sorry, but I don't believe you.

Not a case of coming to any senses, as you stated your premise, any ham on the air is assumed to be licensed and if on HF has passed a code test. Out of this universe you select a group of jammers, out of that group some non-Morse operator uses a keyer to Jam.

The original premise was that of the people issued citations, those that operate CW were not among that subset.

Just as I agree with your premise as stated, the fact is that I have not been able to find a case of jamming by Morse operators that resulted in a citation in the CW portions of the bands.

I am aware that a number of disgruntled hams have operated over W1AW code practice, while one may find this reprehensible, I don't think you can interfere with a broadcast. At least I can find no citations issued.

You were being hypertechnical, and I am now suspicious that you may be the advisor that told Clinton to argue the meaning of "is".

>They DO compare. Neither can be done with
>no training or practice.

Dick is correct; one must learn the code before using it. One must learn how to fly a plane before flying it. The difference is that one teaches one's self Morse code. They can do so successfully in virtually all cases with or without any formal demonstration of that ability. People would not get on the air and try Morse code unless they had learned it first. For that reason, the plane analogy is technically correct, but not very useful to the discussion at hand.

>Ah,but you DID have training and W1BNB sent you some code practice.
>Enough to get you started.

No, he did not. I learned the Morse code from a table, saying "Q dah-dah-di-dah" a lot. He then sent about a minute of text and looked at my copy, asked me to send a few seconds and signed the form that indicated that I knew Morse code. If he had not signed the form, I still would have known Morse code. At that point, with or without the form, I was as ready as I was going to be to operate on the air. The only thing the form gave me was the regulatory authority to do so.

I know you know this.

>Do you really believe that no ham who had never had that Novice style
>training and bit of practice would get on the air and give it a go
>anyway, with a lookup chart, at .00001 WPM?

Sure they might. It is legal for any ham to do so on the only two CW-only sub-bands. If you believe that on-the-air operation should have a minimum speed, it would be more efficient to handle that with a rule about a minimum code speed. Did you recommend that in your comments to the FCC?

Which do you believe to be orders of magnitude easier -- teaching one's self
Morse code or teaching one's self how to fly?

Equating an analogy that is orders of magnitude different than the subject
being discussed is not logical.

>What if a situation arose where people's lives depended on
>communicating with the outside world, and the only mode that
>would work was some form of Morse/CW? Ever hear of a
>fractured larynx?

How many hams do you think have operated Morse code in an emergency because
they had fracturered their larynx?

I miss the list of reasons to keep the code. "You might fracture your larynx
someday in an emergency" could be the #1 answer.

>What if the only HF transceiver available
had a choice between SSB or CW, and there was only a single
>gel cell battery to power it? How long could it transmit on QRP
>CW as opposed to SSB at 100 watts?

I would use the drive or microphone control to reduce power to 10 W PEP SSB;
that would consume less power than 5 W CW.

Reason #2, "You might only have a gel cell and not know how to use your drive
or microphone gain controls to reduce power on SSB."

>The problem with the Morse/CW mode is that in order to
>effectively exploit its practical advantages, one needs to know
>the Morse code! Can you at least agree to that?

Pretty much. You have said it is child's play to learn at 5 wpm, so I am sure
if someone chooses to exploit its practical advantages, they will do so.
Perhaps you would serve the cause more effectively if you expounded on the
practical advantages instead of the parade of demeaning statements you have
made to those who are not presently choosing to use the mode...

What part of "I don't know" did you not understand? I would wager that the percentage of pre-1999 Extras that participated in that particular battle was less than 0.01% of the total number of pre-1999 Extras. For that reason. I don't believe that naming a battle after a group of people that had such a miniscule percentage of them actually participate is appropriate.

I wasn't talking about everyone, Ed, just about myself. Learning Morse
code was one of the easiest things I have ever done. Two hours for
two nights was all it took for about 4wpm. However, my cousin had to
use cheat sheets and later flunked his first 5wpm exam.

"Express Electronics" has been around for a while.

The problem with "export" radios is they are perfectly legal for Hams to buy, and use, so long as it's not on 11m. The only way to reduce the flow of equipment like this from getting into the hands of un-licensed people requires one to provide proof of license before the sale. As of right now there is no such requirement by law. Some Hams believe there should NOT be one either so that those who want a rig can get one, before getting their license, so they can monitor the bands, for example. One solution would be banding the importation, or sale, of any kind of "export" radio. Short of this I don't see much more the FCC can do except chase down the hundreds of large, and small, dealers selling these rigs. I see them for sale, by local CB Radio shops, at many Ham Radio flea markets I go to, and the next table over is somebody else selling "10m" amplifiers.

> However, products they focus exclusively on are illegal CB linears

This is one area where the FCC could make a big difference. There are well known 10m/11m linear amplifier dealers that do business on the Internet. You would figure it would be simple for the FCC to set them up for a "buy", like the DEA does with drug dealers, then bust them. An Internet search engine can track these dealers down at little to no cost to the FCC. There is no question about if the amplifiers are legal to sell or not. The FCC has that area well covered in Part 97. The Detroit FCC office got after the people selling H.F. amplifiers, kits no less, in the tent area at the Dayton Hamvention, so the real question is why don't they bust these guys on the Internet too.

You are correct; I don't remember the question specifically from my Novice exam. I am quite willing to assume that the material that was published in the 4-page study guide was going to appear on the tests. Can you think of any reason that the FCC would have put that material in its syllabus and not asked questions about it? Can you think of any reason that the FCC would ask questions about ohms without asking a question about what an ohm is?

One cannot play a game of checkers with no training or practice
either but there is no governmental requirement for training
because checkers is not a life and death situation. Learning
checkers is like learning Morse code. Learning anything where
one can be physically injured is unlike learning Morse code.

My cousin could send and receive Morse code with lookup charts at
approximately 4wpm. For receiving, he had the chart entries arranged
in a logical manner so he could just follow a flow chart and write
down the character.

"Leland C. Scott" <no-spam@junk-mail.net> wrote:

> The only way to reduce the flow of equipment like this
> from getting into the hands of un-licensed people
> requires one to provide proof of license before the sale.

Every so often a new guy like Leland comes up with the mistaken idea of placing restrictions on the wide availability of amateur radio equipment and supplies. These are the folks who suggest it be a crime to own amateur equipment without a license, and who are not thrilled about the fact that Radio Shack sells a line of UHF/VHF amateur equipment right out under the nose of the impressionable public. I suspect they don't like the idea that soldering guns and schematics are openly sold to those without the proper credentials also.

. . .While it is easy, on the surface, to agree with their goal (keeping amateur equipment out of the hands of bootleggers), I feel the attitude that amateur equipment should be treated as some sort of controlled substance is short-sighted and in fact damaging to our service.

. . .I live in a large metropolitan area. We have one full line amateur store in town. There are no other similar stores in the whole state. In the four states which border us, there are 2 more amateur radio stores. THAT'S IT! In 5 states, there are only 3 stores! In the whole country, my guess is that there are less than four dozen stores selling amateur radio equipment, antennas, and supplies! It is as though we were some secret society, bent on concealing our presence from the world.

. . .Not all that many years ago, there were at least 6 electronic stores here in town which sold amateur equipment (not exclusively, but they all had a good selection). Add to that two Heathkit stores, and even the Sears stores sold amateur transceivers for awhile. (Yes, Virginia, right there along with the Craftsman sockets and Silvertone TV sets.) In the same era, Radio Row in NYC was blocks of wall-to-wall storefronts catering to electronics experimenters. Popular Science magazine had a regular column about amateur radio, and occasional construction articles. Every second little town had an amateur radio club. Amateur Radio was a populist, Joe SixPack kind of hobby.

. . .During those years it was easy for a person to get interested in being an amateur, to shop around for the best

deal on equipment, and to meet an Elmer. We were visible to the public, and well regarded.

. . .Then somewhere along the line came the magic of 1-800 shopping, amateur radio marketing became streamlined, and radio stores disappeared from Hometown America. With the demise of the local radio store, all the Elmers disappeared into their shacks and newcomers flounder around in fancy four-color ads in back of CQ and QST magazine, trying to decide how to be a ham. Clubs floundered, in part due to the loss of hams around the coffee pot in the back of the local electronics part store.

. . .Rather than continuing to restrict the availability of amateur equipment, as though we were selling assault weapons or recreational pharmaceuticals, I vote for opening up the market. Let's have radios for sale in the strip malls alongside the video games, Lionel trains, and mountain bikes. And it won't hurt if a few of us put on our Elmer-suits and lurk around to spot the likely recruits.

When they outlaw ham gear, only outlaws will be hams.

73, de Hans, K0HB/4ID

The Roof of the Universe. And in the Last Days, when the Great Frisbee that shineth in the sky hath gone out, then shalt the Almighty Thrower ascend the Ladder of Life and collect the souls of those who have flown free, and take them The Eternal Park, where we shall sail upon the Spring Breezes for ever and ever, and be Fetched by the Holy Dog. Amen.

Well Dick first let me tell you who I am not. I'm not
someone who judges other hams by their code speed.
I'm not someone who requires that everyone share my
interests or have my skill set.

I am someone who goes well out of his way to teach and
demonstrate amateur radio in order to promote the hobby
and help other hams enjoy it more. This to me seems a better
course of action than berating other hams that don't share
my interests or skills. Last year I attended 16 hamfests in
12 different states from Florida to Alaska doing demos,
forums, teaching and speaking about amateur radio.
What did you and your hero do?

It seems to me that poor Fred has his entire self worth tied
up in his code. What a shame to have done so little in ones
life that all you have to be proud of is an arcane skill,
be that ability real or imagined,

I have a question I think you might be able to help me with.
Why does someone become a sock puppet for an internet
jerk? Is it sort of like those Bozos who hung out with those
schoolyard bullies basking in reflected "glory"?

Shhhhhhhhhhh - can't let things like that out in the regular news stream. How could the Black Caucus or any other left wing extremist group have any right to complain if facts like those are brought out? This reality must be hidden and counter attacked immediately or otherwise the truth might be a popular belief, Sharpton, Jackson, and all the others will be out of a job for the next 8 years if it is revealed Bush got the popular vote... and you wouldn't want to see them on welfare would you?

From _The Development of Modern English_ by Stuart Robertson, rev. Frederic G. Cassidy, Prentice-Hall, Inc., 1934, 1938, 1954, Eleventh printing, 1965. [Not exactly "modern" dumbing down.], pp 1-2.

Chapter One -- Introduction: The Nature and Origin of Language.

"Like most words that are often used, the word _language_ has many senses.... The English _language_, the _language_ of mathematics, deaf-mutes' _language_, 'the subtle _language_ of a women's eyes' -- all these legitimate senses differ so much that some of them, at least, must represent special uses, extensions, or generalizations that have grown up in the course of time, presumably from some basic core of meaning..... we may yet note that _language_ is derived from _lingua_, the Latin word for tongue, which in this case correctly emphasizes speech as the basic thing in language.... _Language is the vocal and audible medium of human communication_....

"To say that language is _vocal_ and _audible_ immediately puts aside everything written--.... For writing is a _record_ of language...[the second level]....

"The dots and dashes of the Morse Code are still on a third level, since they are substititutes for the letters with which we spell out our _records_ of speech; and with them are the gestures of the deaf-mute...."

One of my favorite comments about language involves the difference between a _dialect_ and a _language_. "A _dialect_ is a _language_ without a navy," illustrating the _political_ nature of defining what _lingua_ is "language" and what _lingua_ is "dialect."

And you want to argue whether Morse is a language?

Let me get this straight...random parameters? If there were ever a solution that would drive test takers to memorize the correct answers, this is it.

The problem is, we don't understand the concept of tests and measurement. Yet we think we can design tests. We know that short answer or essay tests place too much demand on the test administers, so we settle for multiple choice -- easy to administer, quick to grade. And then we get bent out of shape when takers know the correct answer -- either because they memorized or because they could figure it out from the distractors or because they knew the answer.

Right now the only way we know folks are memorizing the question and answer pool is because that's what they are saying. We can surmise that's happening for two additional reasons: 1. the Q&A pool is public information and available (therefore people will take the shortcut), and 2. a great many of the questions and distractors are so convoluted and so specific that the logical method is to memorize.

The only thing most multiple choice tests measure to any great degree of certainty is not the subject matter but rather the ability to take a test.

In <941fil$qi4$1@sshuraac-i-1.production.compuserve.com> Vincent Biancomano <103520.355@CompuServe.COM> writes:

>>Uh huh, well, how about sending me copies of your file copies,
>>anyway? I'll even give you a quarter a page to cover your costs.

>As I said Paul, get your info from ARRL. While you're at it, ask
>them of the details of what's gone down the past 10 years
>internally. I wouldn't want to skew the information
>unintentionally, or just in case I've missed the fine details,
>i.e., some nuances.

Dave Sumner, Executive VP at the ARRL, says the following:

Hello Paul,

We have lots of material in lots of file cabinets, but staff time is very limited and we're not in a position either to conduct or to permit searches of files for private purposes.

73,
David Sumner, K1ZZ
Executive Vice President, ARRL

So, to recap, we have the following situation:

Vince points to an 18-year correspondence trail, including letters to the League and newsletters to Hudson Division members during his campaigns for Director, that support his positions. Vince says that reading all of this would give a detailed exposition of his views.

Vince is asked for copies of all of this documentation, even offered 25 cents a page for reproduction. Vince refuses, stating (paradoxically) that his revealing such evidence would made it LESS CREDIBLE (as if it's more credible unrevealed?) because he could be accused of doctoring it. This is reminiscent of Vince's refusing to prove Fred Maia's "women and children" quote unless Fred denies it in writing (Fred says that he doesn't recall).

To paraphrase Dave Sumner, because of practical staff time and other understandable constraints, the League cannot retrieve arbitrary internal documents from years in the past on demand for private purposes (I, of course, suspected that, but did want to get a definitive answer for the purpose of this discussion).

So, Vince says get the documents from the ARRL. The ARRL says (in effect) get them from Vince. If you can falsify an 18 year correspondence trail (properly forging it in detail, including adding

all of the realistic touches, such as historical accuracy and document aging), you *deserve* to have it accepted as authentic (just as if you can memorize a 500-question VE exam pool, you *deserve* to have a license). I suspect that if it existed, it would be a recap of all of the points that you've offered, and we've disagreed with over the years. I also suspect that much of it does not exist in either Vince's or the League's hands (and for no other reason than such documentation either gets lost or is routinely disposed of after some period of time).

Oh, and by the way, which of your opponents for Hudson Division Director made that quote which you paraphrased as:

"you know, there's no reason for Amateur Radio to be a technical hobby today, simply because there's no jobs for engineers. You know, my father was a plumber, and advised me to do the same. Looking back on it, you know, he was right."

?

The individual who defeated you four times says that his father was not a plumber, and nothing resembling such a statement was made by him..

Perhaps exchanges with you in the past along these lines had motivated Gary Coffman, KE4ZV, to say the following:

"Vince, you have provided essentially no documentation, merely a couple of one-liner out of context quotes that you repeat over and over, and a few paraphrased references to obscure documents you *claim* exist but refuse to properly identify or furnish. You are indeed not engaged in debate. You are simply spewing the same old propaganda, depending on repetition in classic Big Lie fashion, in an attempt to win your point. We aren't fooled."

Jerry Altzman, KE3ML, put it a bit more succinctly (and amusingly);

"I have the names of KNOWN TOUGHER-TEST-SUPPORTERS infiltrating our highest levels of government, academia, industry..."

More good quotes like this can be seen at:

http://www.novia.net/~pschleck/vince/quotes.html

But I should let you get back to your work on the Un-Amateur Activities Committee.

> How does the ARRL decide on what is liked or disliked?

By listening to what our members tell us. When we get many compliments
and few complaints on an article, it's not hard to infer that the
membership liked it! (Actually, every PIC-based article we've published
has been well received.)

> >Maybe you need a new set of "others" from which to solicit input. The
> >one you've got now seems to be misleading you.
>
> Jon, from what you've written, I daresy you are rather
> uncomfortable with my opinion. :-)

It's not something that affects my comfort. I'm merely pointing out the
errors that you are being led into by the others on whom you are
relying. If you choose to continue to get your information from sources
that are demonstrably uninformed, it's no skin off me.

> As a non-subscriber to QST, I cannot hope to compete with an
> ARRL staffer who has ready access to the full line of ARRL
> publications.

Yet lacking access to the publications you still draw conclusions about
the editorial policies of the publisher.

> I am not critiquing individual QST articles but
> rather expressing an opinion on the attitude in general of the
> ARRL relative to morse code...over the last few decades...and
> the attitude of the general membership of the ARRL relative to
> morse code proficiency being the paramount achievement in

> US amateur radio.

Your opinion of the membership's attitude led you to the conclusion that the ARRL membership would not accept (your word) publication of an article about a computer-based Morse reader. I've shown you that such an article was published (as others have been, BTW) and the membership did not rise up in outrage. Now, if you approach the topic objectively you might consider that if a premise (ARRL members prize manual code skill over nearly anything else) leads to a conclusion (ARRL members wouldn't accept publication of such an article) that is incorrect, it just may be that the premise is flawed. Which it is.

> I readily admit to not knowing the entire scope of amateur
> radio activity as practiced by over a half million licensed US
> radio amateurs.

Yet you are willing to state with certainty what attitudes and opinions are held by that half-million-plus.

> To be fair, you should admit the very same
> thing. Being an ARRL staff member does not give you some
> magic powers to know the entire scope of amateur radio
> activity...or radio activity that is possibly related to amateur
> activity.

Nope, it doesn't. What it does, however, is expose me to many amateurs holding a broad range of opinions about Amateur Radio, the ARRL and related matters. I don't claim to know all of their opinions, but when there is evidence that suggests that a particular view is widely held, I'm willing to go by it. When someone expresses the opinion that a view IS widely held, I simply want to know what evidence led them to that opinion. And when the available evidence shows that conclusions that follow from that opinion are incorrect, I consider the opinion to be unjustified.

Jon

I guess the sarcastic nature did not come through as I had hoped.
If God were such a boon to the liberal agenda, why are 99% of them trying to remove Him from of everything? No prayer in schools, no 10 commandments, abortion runs rampant, etc. I really don't think God wants His name attached to such blasphemous activity!

And why should that be a mistake? You have to provide proof of insurance to get plates for a vehicle, provide a prescription from your doctor at the drug store for powerful drugs, a photo ID (normally a driver's license) to pass a check, same thing with trying to buy booze, or get a drink at a bar, cops wants to see your driver's license when you get pulled over etc. The list goes on and on. There are many things we are required to provide proof that we are who we say we are, and that we can do something, or we are authorized to be where we are. Normally we just don't think about all the cases. Asking to see your FCC license is not a big deal.

So when you get pulled over by a cop, and he notices you are getting public service calls over your mobile rig, and tells you that you can't have a scanner in your vehicle. You going to tell him you are a Ham, then refuse to show you license when he asks to see it, and then tell him to go bugger off because you don't have to?

> These are the folks who
> suggest it be a crime to own amateur equipment without a

I have been to plenty of Hamfests where the policy is NOT to give a winner of the door prizes a Ham Radio TX of any kind UNLESS they have a license. Instead they give them cash in the case they are unlicensed. So in a way it's already being done. I bet you never even thought about it, even bothered to notice.

If you are of average skills I can teach you to take off and land an airplane safely, as the sole occupant in about 10 hours.

I suspect I would spend more time teaching you Morse code to the level I could "solo" you on the band. This assumes 5 WPM as the solo level.

How long it would take to teach yourself is another matter. However I once worked with a guy who was an avid simulator pilot that could probably have soloed in 4 hours. he claimed several thousand hours on his Microsoft flight simulator.

How could that be? The answers would not be available until the
exam was generated. The examinee would see the answers for the
first time when he/she takes the exam under the watchful eyes
of the VEs. Every exam would be different.

Sigh. The question is really "Is there a problem which is bad enough
that we would insist on the expense and the enforcement of checking
for a license before the sale?"

That's a judgement call.

>> These are the folks who

>it's already being done. I bet you never even thought about it, even
>bothered to notice.

Personally, I don't think it's that big a problem.

The real problem is that the FCC isn't enforcing its own laws very well. Laws against unlicensed operation exist. Maybe the FCC would consider licensing something like an Official Radio Monitor (Kind of like the ARRL OO, but with some sort of legal standing in a court of law) who could be called at a moment's notice to DF a signal they can't afford to track down.

Then the real problem would disappear.

Leland, I respect your position, but I can't help thinking that you're fighting the symptom, not the disease.

In article <93vo6mqvf1@iac5.navix.net>, "W4JLE" <Fred@w4jle.com> writes:

>Of course it does, same as it makes me better at that skill than one who has
>never figured an exposure problem.

"Better?!?" I thought the Jelly Jermiad bespoke of "superiority"?!?

Figuring exposure: I did that as an teenager, could F-stop and
shutter speed under stated ASA film ratings as good as pros.
I did radiation exposure problems in late twenties, am still
alive. I did field strengths for SID antennas in my forties and
was able to measure them accurately...compared standard
antennas to new development antennas on a range at the
same age. All of them without needing CW skill. All of them
without having to attend formal classes having grades and
neat little certificates of "graduation."

>Ed, the demonization of someone being superior is a product of the feel good
>generation. Soccer games for kids that do not keep score ,so no one feels
>bad. Gradeless classes for the same reason.

Heh heh heh...the ultra-conservative wanting SCORES,
brag-rights indicators of "superiority" to others. No one
allowed to "play" just for the love of playing?!?

Heh, my cousin Leif in Sweden played soccer (with scores
and international football rules) until he was 55. Did he
do that for showing his "superiority" or did he just like to
play the game, win or lose?

>One could go on forever listing the esteem building exercises.

Tell everyone more about your wonderfulness, Jelly. I think it
would be an interesting display of encouraging newcomers
to take on a hobby, to show "incentive" in order to be as good
as you.

>The reason you see such vitriolic response, is for many this is the first
>time in their life they have been told they don't measure up.

"Measure up" to WHAT, old-timer? :-)

Standards and practices of the 1930s?!? WHY?!? :-)

Just who, or which divinity, has decreed that morse code skill is
the epitome of amateur radio excellence...that all "must" have
that skill to be "accepted" by the Superior Beings?

This newsgroup was created primarily to be a forum to discuss
the code test for amateur radio license examinations. From
day one it was obvious that the self-styled "superior" ones were
personally attacking those that did not want the code test.

>Do you not
>sense the "it's my God given right to be equal in all respects regardless of
>effort" attitude in the responses?

I sense, detect, and almost blinded by Day-Glo letters of "CW skill
is superior to all other forms of endeavor in anything and therefore
[Jelly] is superior to others who cannot be as godlike as [Jelly]."

The FCC determines what constitutes essential requirements for
a US amateur radio license. Not the "amateur community." Not
the ARRL. Not what is currently done in amateur radio. Not the
traditions and urban myths of now-ancient history in amateur radio.
Licensing is part of the FCC's task of regulating US civil radio. The
license test isn't an academic test of any kind. Never was.

The FCC has stated in 1990 and in 1999 that it does not consider
a morse code test as relevant to amateur radio licensing in order
to regulate amateur radio. It stated that the FCC must continue to
do so because of existing treaty-cooperative ITU-R standards.

As far as I've been able to see over a three year period, none of
the no-code-test advocates has proposed an outright banning of
morse code USE in amateur radio. The only advocacy is the
elimination of the morse code test itself.

If that morse code test is considered necessary to prove some
kind of moral-ethical-mental superiority...as often stated by
those who have passed such tests...then the only conclusion
to be drawn is that their moral-ethical-mental standards are
questionable. It seems to fall to the obvious -

"We had to take the test so all the newcomers have to take it."

Selfish emotionalism is not a good reason for regulations.

>
>Fred, oops. You were supposed to be better than everyone else.

Brian, a correction...Jelly is superior, not just better.

I find his admission of a "failure" to be shocking. The era of 7-pin
glass base beam power pentodes ended over two decades ago
with components growing steadily smaller...while the egos of
those who said they "dealt" with tubes grew steadily larger. :-)

My wife is older than Jelly and she does excellent fine-detail
cross-stitching. Her headband magnifier helps. I've been
under treatment for glaucoma for a quarter century and can
still see very well close-up. No problem with unsteady hands
here...but that may be due to constantly working with
electronics, adjusting and improvising. No amount of ego can
move electrons or generate RF, it takes application and
learning-with-the-components, learning about components.

The pin-to-pin spacing of dual-inline IC packages is about the
same as the pin-to-pin spacing of a 7-pin miniature glass
tube. The 1949-operational AN/PRC-6 military handy-talky
had 12 subminiature glass tubes whose pin-to-pin spacing
was half that of the single 7-pin tube of the PRC-6's PA.
That is 52 years ago. I wonder where all these "superior"
hams have been that whine and complain about not being
able to "deal" with 6AQ5s?

Maybe all of those whining, crybaby "superior" oldsters can
only "deal" with power triodes like the 833 having only four
large cap-contacts and no base, grid and plate caps being
around 3 to 4 inches apart? Gonzo sizes to fit gonzo egos?
:-)

How about a 5 question test for General.

1. State in 300 words or more why you want to be a ham.

2. Describe the procedure for calculating, adjusting, and connecting a 15 meter dipole cut for the center of the phone band.

3. Explain the difference, if any, between an AC ground and a RF ground. Elaborate as to how each contributes or degrades operator and property safety.

4. Explain the procedures to make a contact on a non voice mode of your choosing.

5. Your neighbor calls and says you are interfering with his television, you are at a loss as to how to solve it. What do you do next?

Now even if they memorize the answers they at least have some practical knowledge.

Yes, he is. That is why this country outlaws all abortions and all contraception. That is why we have forgiven our debtors. That is why there are so many new Catholic schools and churches. That is why prayer in public schools is not only allowed but encouraged. That is why education is taught from a high moral perspective and history is interpreted as the fight between good and evil. That is why we have our ultimate political example of Catholic morality, Senator Kennedy.

Got it?

For those who get their shorts all knotted up about CB lingo on the ham bands, here is an excerpt from a book written 60 years ago by Clinton DeSoto.

"Among radio amateurs there is a genuine brotherhood and informal camaraderie. Everyone is called by his "handle" -- his first name or nickname. The president of the Chicago Stock Exchange and the mechanic in a Birmingham garage are just "Paul" and "Joe" when they meet on the air."

As I alluded to in my previous message, If the FCC monitoring
facilities are taxed, why not certify certain amateur radio stations
as a legal observer who can give expert testimony? Then one would
only have to alert these observers to the problem, they'll track the
bugger down and the FCC would decide how to prosecute the offender.

This is certainly less costly than assuming the whole enforcement
burden, and hopefully this could enable the FCC to use its funding
more wisely.

A lot less time consuming that having to learn code. My problem with the FCC exams is they do not test the practical aspect of ham radio.

If we are remove the CW requirement, we should at least insure the new amateur has a practical understanding of operations. We might instead make it a requirement that the new amateurs station be examined by a volunteer group similar to the VE groups and signed off for operation. I worry that some of the newbies can jump from zero to 1.5 KW with no practical knowledge of the consequences. I go back to the flying without lessons. In this case serious jeopardy awaits those that lack instruction in safety and what could happen when you reach inside that new linear with the pair of 3-500Z's.

Before you ask what CW has to do with safety, in the process of learning from an Elmer or a club these issues are brought up by an experienced amateur. With the ability to simply answer a few questions on a written, one could conceivably be an extra and have never even seen a radio. No one on one contact with a ham is necessary.

I'm sorry; poor choice of words on my part. QST doesn't run the Review until we have all of the accessories we want to include. (Filters, tuners, etc.)

What doesn't always get reviewed is every station accessory available, ie wall clock, keyer, etc.

The QST column "Short Takes" does include a lot of the lower-end products, though; it was added sometime last year to let ARRL take a closer look at more equipment.

In case a few members missed it, the entire QST Product Reviews from 1980 onward are available at the ARRL members pages at http://www.arrl.org/members-only. The expanded test reports are available there also. As each issue is sent to the printer, the Product Reviews are put up there, giving members a faster look at them.

Do you believe that the following represent practical knowledge?

T4B07 @N4C06 (B)
If an SWR reading at the low frequency end of an amateur band is
2.5:1, increasing to 5:1 at the high frequency end of the same band,
what does this tell you about your 1/2-wavelength dipole antenna?
A. The antenna is broadbanded
B. The antenna is too long for operation on the band
C. The antenna is too short for operation on the band
D. The antenna is just right for operation on the band

T4B08 @N4C07 (C)
If an SWR reading at the low frequency end of an amateur band is 5:1,
decreasing to 2.5:1 at the high frequency end of the same band, what
does this tell you about your 1/2-wavelength dipole antenna?
A. The antenna is broadbanded
B. The antenna is too long for operation on the band
C. The antenna is too short for operation on the band
D. The antenna is just right for operation on the band

T4C01 @T4B01 (B)
How is a voltmeter usually connected to a circuit under test?
A. In series with the circuit
B. In parallel with the circuit
C. In quadrature with the circuit
D. In phase with the circuit

T4C02 @T4B02 (A)
How is an ammeter usually connected to a circuit under test?
A. In series with the circuit
B. In parallel with the circuit
C. In quadrature with the circuit
D. In phase with the circuit

T4D01 @N4D01 (C)
What is meant by receiver overload?
A. Too much voltage from the power supply
B. Too much current from the power supply
C. Interference caused by strong signals from a nearby source
D. Interference caused by turning the volume up too high

T4D02 @N4D02 (A)
What is meant by harmonic radiation?
A. Unwanted signals at frequencies that are multiples of the fundamental (chosen) frequency
B. Unwanted signals that are combined with a 60-Hz hum
C. Unwanted signals caused by sympathetic vibrations from a nearby transmitter
D. Signals that cause skip propagation to occur

T4D03 @N4D06 (B)
What type of filter might be connected to an amateur HF transmitter to cut down on harmonic radiation?
A. A key-click filter
B. A low-pass filter
C. A high-pass filter
D. A CW filter

T4D04 @N4D08 (C)
If your neighbor reports television interference whenever you are transmitting from your amateur station, no matter what frequency band you use, what is probably the cause of the interference?
A. Too little transmitter harmonic suppression
B. Receiver VR tube discharge
C. Receiver overload
D. Incorrect antenna length

T4D05 @N4D09 (D)
If your neighbor reports television interference on one or two channels only when you are transmitting on the 15-meter band, what is probably the cause of the interference?
A. Too much low-pass filtering on the transmitter
B. De-ionization of the ionosphere near your neighbor's TV antenna
C. TV receiver front-end overload
D. Harmonic radiation from your transmitter

T4D06 @N4D10 (B)
What type of filter should be connected to a TV receiver as the first step in trying to prevent RF overload from an amateur HF station transmission?
A. Low-pass
B. High-pass
C. Band pass
D. Notch

T4D07 @N4D11 (B)
What first step should be taken at a cable TV receiver when trying to prevent RF overload from an amateur HF station transmission?
A. Install a low-pass filter in the cable system transmission line
B. Tighten all connectors and inspect the cable system transmission line
C. Make sure the center conductor of the cable system transmission line is well grounded
D. Install a ceramic filter in the cable system transmission line

T4D08 @N4D12 (C)
What effect might a break in a cable television transmission line have on amateur communications?
A. Cable lines are shielded and a break cannot affect amateur communications
B. Harmonic radiation from the TV receiver may cause the amateur transmitter to transmit off-frequency
C. TV interference may result when the amateur station is transmitting, or interference may occur to the amateur receiver
D. The broken cable may pick up very high voltages when the amateur station is transmitting

T4D09 @N4D13 (A)
If you are told that your amateur station is causing television interference, what should you do?
A. First make sure that your station is operating properly, and that it does not cause interference to your own television
B. Immediately turn off your transmitter and contact the nearest FCC office for assistance
C. Connect a high-pass filter to the transmitter output and a low-pass filter to the antenna-input terminals of the television
D. Continue operating normally, because you have no reason to worry about the interference

T4D10 @N4D14 (C)
If harmonic radiation from your transmitter is causing interference to television receivers in your neighborhood, who is responsible for taking care of the interference?
A. The owners of the television receivers are responsible
B. Both you and the owners of the television receivers share the responsibility
C. You alone are responsible, since your transmitter is causing the problem
D. The FCC must decide if you or the owners of the television receivers are responsible

T4D11 @N4D15 (D)
If signals from your transmitter are causing front-end overload in your neighbor's television receiver, who is responsible for taking care of the interference?
A. You alone are responsible, since your transmitter is causing the problem
B. Both you and the owner of the television receiver share the responsibility
C. The FCC must decide if you or the owner of the television receiver are responsible
D. The owner of the television receiver is responsible

T5A01 @N5A03 (B)
*Modified Q,A-D
If a dial marked in kilohertz shows a reading of 28450 kHz, what would it show if it were marked in hertz?

A. 284,500 Hz
B. 28,450,000 Hz
C. 284,500,000 Hz
D. 284,500,000,000 Hz

T5A02 @N5A05 (C)
If an ammeter marked in amperes is used to measure a 3000-milliampere current, what reading would it show?
A. 0.003 amperes
B. 0.3 amperes
C. 3 amperes
D. 3,000,000 amperes

T5A03 @N5A09 (C)
How many hertz are in a kilohertz?
A. 10
B. 100
C. 1000
D. 1,000,000

This may work since the bill was passed allowing enforcement of the CB Radio
Part 95 rules by local LEOs. Hams could volunteer to help in that area as
part of our public service function. Now the question is, how many would
even bother to do so?

Sure you can...but you have to HAVE a license to play. So WHAT
would YOU know about it?

> Tell everyone more about your wonderfulness, Jelly.

Seems I don't remember Fred addressing you as anything but Len,
ergo why the name calling, Lennie?

Again, you prove me right. Thank you.

> "Measure up" to WHAT, old-timer?

Regardless of what the "WHAT" is, YOU don't make it anyway.

> This newsgroup was created primarily to be a forum to discuss
> the code test for amateur radio license examinations.

And like almost all things, it has evolved. You should try it.

> I sense, detect, and almost blinded by Day-Glo letters of "CW skill
> is superior to all other forms of endeavor in anything and therefore
> [Jelly] is superior to others who cannot be as godlike as [Jelly]."

More name calling which Lennie has repeatedly denied doing.

When will this lying creep realize he's an idiot who's number has
been had?

> The FCC has stated in 1990 and in 1999 that it does not consider
> a morse code test as relevant to amateur radio licensing in order
> to regulate amateur radio. It stated that the FCC must continue to
> do so because of existing treaty-cooperative ITU-R standards.

Yet YOU keep assailing AMATEURS for it's retention. Here you
state the FCC has clearly stated that international treaty is
to "blame". So which is it, Lennie?

>It seems to fall to the obvious -

What falls to the obvious is that you manipulate "facts" to
justify the rant of the hour.

> "We had to take the test so all the newcomers have to take it."

Not true, and you have been invited in. You spurn the offers
based on YOUR alleged moral superiority..."Why should >>I<< allow
myself to associate with such heathens...?!?!?"

> Selfish emotionalism is not a good reason for regulations.

Or a good reason for revoking regulations, either.

All it takes is money. The Commish' is stupid not to do it
while there are still agents left who have the capability and
the desire to do it. The old-timers like me are all gone (with
two notable exceptions nationwide) and our immediate proteges
who at least served a few years while we were around are
getting up to retirement time pretty soon.

There is no "new crop".

All it takes is money and a committment from above.

The new chairman-designate has ZIPPO understanding and support
of what the real mission of the agency should be. He proves it
in his public pronouncements.

>Laws against unlicensed operation exist. Maybe the FCC would
>consider licensing something like an Official Radio Monitor (Kind of
>like the ARRL OO, but with some sort of legal standing in a court of
>law) who could be called at a moment's notice to DF a signal they
>can't afford to track down.

We used to have them -- they were called "FCC engineers". I
got called out too many times to count in the "good old days".

The question came up about "volunteer agents" - similar to
police reserves - when the Amateur Auxiliary was formed. Both
the enforcement and the legal folks came to the same conclusion
that there are specific training and legal qualifiction problems
in that sort of arrangement on the Federal level, and that's why
the Amateur Auxiliary was crafted the way it is.

The problem is getting the legal folks both inside the agency
and outside (the Justice Department) to move on what we
amateurs consider a "major problem" but what, in the law
enforcement community, is really small potatoes - or so I've
been told by more than one U S Attorney.

The term "troll" usually has some pretty negative implications. Do you believe that this post was intended only to goad people into arguing with each other for the amusement of the poster?

I believe that Hans posted it because it was a neat piece of information that has relevance that may just stop one tiny bit of the arguing we do here.

Hans, please find another tidbit to use to try to convince people not to argue over insignificant details like 11-meter ops using the term "handle" instead of name. :-)

Read it again, Hans. Key in on the phrases below. 73, Brian

He finds amateur radio "the means of communications with others on equal terms, of finding friendship, adventure and prestige while seated at one's own fireside," according to Dr Raymond V. Bowers. "In picking his human contacts out of the air, theamateur is not seen by them.... He is not known by the company he keeps nor by the clothes he wears, but by the signal he emits.

-ON EQUAL TERMS

-KNOWN BY THE SIGNAL HE EMITS

It stands for the maintenance of fraternalism and a high standard of conduct.

-HIGH STANDARD OF CONDUCT

In early days amateur stations used code alone in their transmissions. These days they use both voice, or 'phone, and code, or c.w. (continuous wave) telegraphy, theproportion being about one third 'phone and two thirds c.w. Actually, all amateurs mustbe able to understand the radio code. A 'phone transmitter, involving microphone, speech amplifier and modulator, is more complex and expensive than one for c.w. alone which needs only a telegraph key (no transmitter?). There is a traditional rivalry (not warfare) between confirmed addicts of the two methods, a rivalry comparable to that between sailing-boat and power-boat owners or between sailplane and airplane pilots.

To be considered a "good ham" is just about the highest mark of honor there is.

Among radio amateurs there is a genuine brotherhood and informal camaraderie

Fraternalism ... good fellowship ... ingenuity ... public service ...

That's what amateur radio is like.

Ed, who tought Orville Wright to fly? Who taught Sammy Morse the code?

Either can be self-taught. Today it just depends on the gubmn't
regulations.

> > I've talked to a few people on CW who didn't know the Morse code...

I have too, Aaron, on purpose. We set up a little cross-band QSO where I worked a bunch of new VHF only hams by transmitting Morse code on 40 meters and listening on 2 meters. A local op manually retransmitted my 40 meter signal, using a 40 meter receiver and an HT.

The hams, most of which were not code proficient, only had to learn how to recognize their call on CW and make the QSO with me. I sent them a signal report, which naturally was 59. :-) There was one old timer who just wanted in on the fun and one Tech+ who didn't have CW equipment who had never made a CW QSO.

It didn't change the world, mind you, but we all had a good time, tried something new and learned that CW is a real mode in ham radio.

Oh, and none of them complained about my timing. I had to use a J-38 to slow down to 5 wpm non-Farnsworth.

The Novice License and the original Technician License both got their start at the same time on July 1951. The Tech Plus (5 wpm) and the No-Code Tech came later. The Novice and Tech Plus were eliminated recently in the dumb restructuring program. While the Novic License was not producing many new Novices, let us not discount it as an entry to youths who prefered to start becoming real HF Hams...Or haven't you noticed.

> It was the FCC that made the decision to eliminate the Novice,

The FCC makes its decisions based on the bragging and complaining of Hams and those who lobby for them (like the ARRL)...unfortunately not always on common sense or with an eye to the survival of ham radio or its educational benefits.

> >They informed us that there was
> >need for hams to understand how to comply with recent RF hazard

It did add more questions to Novice and Tech Exams and was supposed to
add more questions to other exams as they came up for being
updated...but sadly the new restructured exams do not contain much RF
hazard content nor are the tables and graphs that are used as aides to
answering RF hazard questions given to applicants for the new exams.
I'm surprised that YOU didn't know THAT!

>
> >IMHO ham licensing was always meant to be an incentive

granted by the
> license properly.

The basis and purpose (as written in Part 97) of ham radio has often
been cited by me. It is a general goal for all hams. The exaqms are
used as incentives for the applicants to begion to prepare to generally
meet those goals.

> > I dunno what our Ham leaders motives are for sure. Can it be that

Is it because they don't trust VEs?....or is it because they don't
trust themselves to propose any solutions that might make ham radio
compatible with modern computer science and technology???

> >At least some of the real expert hams
> >need to show that they have been given not just an incentive but an
> >education by being hams..
>
> Yes, they do, and the best way to do that is to do something with that
> expertise within ham radio, not by passing another FCC exam.

I disagree. What youy say can be true for individuals BUT it can
never apply to HAMS AS A GROUP unless it is part of the Ham licensing
structure.

> > I am the first to admit that all Hams are not Hams
> >for the same reasons or with the same motivations.
>
> You may admit it, but you are seeking to require that everyone in ham
radio
> follow the path and motivation that is right for you...

Nope...All Hams need not get to be Extra Class or to obtain specialist
technocal endorsements.
Lots of kids play baseball just for fun. Most sand lot players may
never get to be professional baseball players...BUT the dream is there
among ever kid when he or she starts to play...maybe I'll be good
enough to grow up to be a PRO. In the same manner Ham Radio no longer
offers a gateway to any real professionalism. This was not true in the
30s and 40s when a ham ticket was an early step toward getting a
commercial radio operator license. The commercial license could get
you a job as a broadcasting engineer or a ship board radio operator.
You had learned Mortse code as a ham...and you had learned how to
adjust and neutralize high power RF transmitting vacuum triodes. Both
of these skills mean nothing today as far as commercial values go...BUT
in order to attract new techies the FCC Ham licenses must replace these
practices and skills with the digital and networking skills now valued
commercially. If this does not happen...no self respecting techie can
be motivated to sopend any time as a ham.

> > Nor do all Hams care to get compulsively involved with education,

handful of
> hams will have all of those priveleges.

I Disagree. The fact that the structiure is there would be just like
the fact that there is amateur, semi-pro and pro baseball. Without any
pro baseball, sand-lot baseball would cease to attract as many

youngsters as it does.

> >Viva la difference. IMHO this means that three classes of license
can
> > never fit all!
>
> 300 classes of license can never fit all, by your "logic."

Nope...I'll settle for 30 classes.

> >and most of those few are credited with their knowledge...not because
> >of what they learned preparing for any ham exams but because of what
> >they learned elsewhere.
>
> Exactly, and those are the ones who could take and pass your elite
exams, Bob,
> but they know they don't need to.

Those are not the only ones. We have seen many hams of the past and
present who could pass the higher level exams due to their own self-
study and practical experience.

> >BUT Ham Radio must also be a sequentially challenging hobby

or she
> sees fit.

You can lead a ham to Yaesu...but you can't make him think.
>
> >It must be able to introduce those who care to be introduced to an
> >understanding of modern electronic communications systems and methods
> >that can be applied by Hams to advance their state of the art.
>
> Yes, it should, and those >1000 questions in the question pool should
be
> changed to reflect just that.

What 1000 questions? 35+35+50= 120 multiple choice questions to make
Extra....from a fixed pool of 1000 or so and only 75% needed to
pass...less if you guess the rest by the laws of probability.
Heck a common hacker needs to be able to handle more knowledge than
that.

> >These widely different needs are in conflict and can only be solved
by
> >a more complex and divergent licensing structure.
>

> How can such needs be in conflict?

The conflict exists between those affluent people who seek Ham Radio as
a fun hobby...and the lesws affluent masses who will only become hams
if ham radio can offer a possible gateway to a vocation or profession.

> That statement is nothing more than emotive
> words strung together. If there is such a technical conflict, adding
a more
> complex licensing structure will not accomplish anything.

AND WHY NOT???

> >BASIS and PURPOSE that can be relied upon to maintain enough clout to
> >retain our governments' continous support.
>
> Your premise that amateur radio will have clout if hams pass more
tests is
> without merit. In all of the speeches the FCC has given to hams
lately, urging

I disagree.

> Perhaps it would be helpful if you directed your energy towards
something that
> the FCC will not shoot down in flames.

The Hams themselves and not the FCC may be burning their own britches
by not understanding the only real surviving purpose that ham radio can
offer.

>applicant must demonstrate proficiency in Morse code before being allowed to
>try the mode on HF. People would learn the mode, or write some really cool
>software, before trying it, would they not?

Ed:

You couldn't be wider of the mark. Morse/CW is the only mode which,
in order to be effectively employed, requires the user to learn and
master a physical skill which exceeds the learning curve and
committment level demanded of the other modes. Any person who can
read an instruction manual can get a multi-mode TNC up and running --
that's exactly how I did it. If they read a bit more, they will be able
to exploit it more fully, as I have. However, the Morse code is
different. If I hadn't put in a considerable amount of time and effort
to learn it properly, and had I not spent more time practicing it
regularly, I would not have achieved what I call "working proficiency"
in that mode. And, in spite of this working proficiency, I am still
far from what I'd call an "expert." I shall probably never attain that
status -- but I could hold my own handling traffic at what I consider
to be a reasonable speed, 18 - 22 WPM.

Your argument that the other modes require equal testing status
doesn't hold water, since using them doesn't require the user to be
able to employ the same kind of conditioned response to external
stimulation that is the essence of Morse/CW operation. All it
requires is that they be able to see or hear the output of their
transceiver through whatever interface is required (speaker, video
monitor, LCD display, etc.)

BTW that Kenwood IC-R3 comm receiver has me hot and bothered!
Thank Steve Ford for me, for an excellent review! It just may be
the basis for my purchase of that rig!

Close to none, 'cept maybe some cop wannabes. The misbehavior of the CBers and
freebanders is an FCC enforcement issue which has no impact one way or another
on ham radio. Fact is they don't have any real impact on anything which is why
they're on the low end of the FCC's list of priorities.

Why would they? I heard that you are the op behind W1AW's sterile code.

BTW, when you took the 13 and 20wpm exams in front of the FCC examiner,
did you dazzle him with your coconut boat swing?

Or did you send it by the book?

Ed, this wouldn't be a fair test. no-coders aren't smart enough to build things, least of all their code speed.

Well, as A liberal, more a libertarian or independent, I think you've
got it wrong. All liberals do-not bow when Al Sharpton let's a fart or
were happy about Senor Clinton's little extra marital affair.
What the issue is and YOU conservatives distort it for your own agenda,
is Christain faith, i.e. the Bible is NOT the religion of all Americans.
We have the right of worship and the right NOT TO.
I haven't seen any church closings lately or the FCC putting any of
those fire and brimstone shortwave pocket picking preachers off the air.
Quite the contrary.
As for abortion.. I'm opposed to it, but not because of a religious
doctrine. Basically I say, why is it murder to strangle an infant after
birth, but perfectly OK to crush its skull, inside the womb?
Seems bizarre doesn't it?
And why do abortions take place? Because somebody wasn't being
reponsible with sex!!
Now, I'm a liberal ? Do I sound like one ?
Well, I think Bubba Bush will be the worst president we've had in 40
years.. but I could be wrong.

You're so right! I recall hams using handle before CB was popular.
In fact that term was stolen from ham lingo.
Apparently some of the non-old timers, who were not around in the 1960s,
aren't aware Handle was in common useage.

I did hear somebody say 10-4 the other day on 40, and quite frankly
thats not from CB either.. a stolen product. The COPS have this as a
part of their 10- code.. I am told.. and have had for decades.

This is why I am a proponent of one amateur radio license, simply called "Amateur Radio License." Do as much or as little with it as you like.

You can brag about an HPM 35wpm certificate on the wall if you want.

Or you can write code for the hottest new amateur digital mode.

Or you can help scouts get a radio merit badge...

Ya know ED, I must've of read 60 of your posts tonight in various threads and you're a living example of the Leagues restructuring proposal. You won't promote anything that will improve ham radio and neither will your employer!

ARRL policy makes me want to vomit.

You got it right. I'm sure your just trying to be nice. But the basic
fact is CB stole most, if not all, of their proceedures and pro-words
from either Ham, public service, or commercial service radio services.

I'm willing to share that Riley has commented on the disproportionate
number of "advanced" hams that get in to regulatory trouble. I don't
know why thy're so unfamiliar with the rules, so don't ask me.

So when I hear of ham misbehavior, its not a stretch to imagine an Extra
doing it.

It was obvious at the time that the CBers got it from us. Just
as they got their mutilated "10" codes from the police community.

The "country" and "good buddy" lingo came from an individual in
the Ozarks who was on the air some 20+ hours a day in the late
60s and actually talked like that as a regular thing. We used to
hear him very plainly at the monitoring stations in California.

The VEC fee is a session fee which means you can take as many exams as you like at a single examination session for one $10 fee. If a VE is charging the $10 fee per element at the same exam session, he needs to re-read his VE manual.

>could "solo" you on the band. This assumes 5 WPM as the solo level.

These two examples are logically incongruent. There is no
need for flying skills in radio operation, any radio service.
To be legal, one has to have an amateur radio license in
order to transmit RF in the amateur radio bands...but the
necessity to "solo" for an amateur radio license in not a
federal requirement.

>How long it would take to teach yourself is another matter. However I once
>worked with a guy who was an avid simulator pilot that could probably have
>soloed in 4 hours. he claimed several thousand hours on his Microsoft flight
>simulator.

The above is both incongruent, illogical, and rather absurd.

As to self-learning radio arts, be they technology or
operating practices, that can be totally self-taught.

In a career of design and development of radio and
electronics, both myself and the vast majority of
career contemporaries were "self-taught" on the changing
state of the radio-electronics arts. There was no time to
attend "formal schooling" or get "accreditation" through
nice little paper certificates with grade points to attest to
"qualified new skills." Myself and the vast majority of my
career contemporaties already had formal schooling.
There were hardly any instructors or courses for each
new radio-electronic art that evolved.

By comparison, the necessary knowledge to get an
amateur license and to begin in the amateur radio
hobby can be entirely self-taught. There is no federal
requirement to "solo" in amateur radio under some
"instructor" who will "rank a student" based on the
"instructor's" opinion.

The amateur radio "solo" requirement is some
flight of fancy, or rather a fantasy based on some
"instructor's" aberrant self-professed "superiority."

If that is permissable evidently they have changed the rules. When I
ran a VE team ('85 thru '93) the rules said one fee for all tests taken
at that session. Later it was deemed permissable to charge an additional
fee for a retest of a failed element at the same session, but we never
did.

There are an infinite number of circumstances that could occur. Suffice
to say only that Morse code communications on ham radio is the most
easily and widely available method of communications under the most
variable of circumstances requiring the least amount of overhead of any
amateur radio method - So long as hams are trained so as to be able to
use it.
That fact alone is reason enough to require hams to learn to make use
of it if the ARS is to be considered as a viable communications
auxiliary asset. If it is not, then it is fundamentally changed in its
nature and is well on its way to being nothing more than a hobby on par
with stamp collecting. Clearly there are those posting here who believe
it to be nothing more.

Seems ham radio has saved
> them from a life of crime. Seems that is a good thing to me. Do you
> disagree?

No, I don't disagree. What I disagree with is your premise that all
persons who so flagrantly violate whatever rule they please at will
should then be assumed to have reformed and become model citizens just
because the FCC gave them an essentially effortless and free ham radio
license. Those types don't reform just because they now have a ham
license in hand. For far too many it just opens another door to
mischief.

Phil, the etymology of the word "handle" goes back to the West of America and the American cowboy, used about the time an itinerant portrait painter in the east got financial help from a railroad family to develop a new landline communications mode.

Does the name Broderick Crawford ring a bell?

> The "country" and "good buddy" lingo came from an individual in

Phil, again you have to go all the way west to Hollywood and a number of motion pictures and made-for-TV-films on the patois of CB...or to natives of Oklahoma who grew up to drive 18-wheelers and big rigs cross-country for a living. Oh, yes, we've heard them very plainly next to I-5 in Southern California... :-)

I'm wondering what kind of nonsense is being foisted on everyone. It is saintly and authoritative to refer to a location as "QTH" but it is evil mutilated robbery to refer to a location as "10-20." On voice. Why can't folks simply say "location?" :-)

Roger that.

Unless the ARRL has changed, it's not quite a session fee. It is insofar
as you can take one of every element for one fee. Retakes of failed
elements are subject to another fee.

Cecil:

Bill and I agree that the 5 WPM requirement should be eliminated,
but for different reasons. He doesn't see the value of *any* code
testing whatsoever; I say that a 5 WPM maximum code test is
virtually no code testing as it is...therefore, there's no point in
maintaining a requirement which will not foster operational
proficiency.

If 10,000 armed citizens emerged on the steps of the Capitol, I don't
think they would be very concerned with being arrested. However,
it would be up to those who might do the "arresting" to decide whether
or not the shooting was going to start. Arresting people for acting on
their Constitutional rights would be a good way to do that.

US amateur licenses are far from effortless, Dick. To get one requires studying a 200+ page book and learning from a question pool that is about 20X more material than the 4 pages I studied to get my license.

I think you already know this.

And that is exactly how I suggest that the mode be tested. As part of the exam, a 5-minute code segment should be sent and the applicant should be required to answer questions about its content, just as is done now.

What would equalize the testing with the way other modes are tested would be to include those questions in the overall exam, and require an overall pass rate of 75%.

Where did hams get their use of Q codes?

I see nothing wrong with one radio service using the procedures developed in another.

Interestingly, the use of the 10 codes on voice is seen by some as having more validity than the use of Q codes on voice. Why does one create such moral outrage if heard on amateur frequencies?

How could they memorize randomly generated answers? ESP? :-)

>And then we get bent out of shape when takers know the correct answer --
> ...because they ... knew the answer.

Are we now getting upset because the new hams might actually know the answer?
:-)

>Right now the only way we know folks are memorizing the question and
>answer pool is because that's what they are saying.

I have met only a handful of people who claim that they memorized the answers
to the ham tests. One of them is Cecil, who says he memorized the answers in
the 1950s. I personally think he knew more of the material than he thinks he
did.

>1. the Q&A pool is public information and available (therefore people will
>take the shortcut)

IMHO, the easiest way to pass the test is to know and understand the material.
I could not memorize the answers to hundreds of questions that I did not
understand.

> 2. a great many of the questions and distractors are so convoluted
> and so specific that the logical method is to memorize.

Are you saying that the questions should not be convoluted and specific? The
opposite of that is simple and vague.

If people memorize hundreds of right answers, they have learned more material
than I did to get my General in 1964.

If I remember his post correctly, Larry Roll has you beat. He can use a lookup table to decode an unknown OOK character set at either 10 or 13 wpm; I forget which.

Of course, he never did take me up on the lobster-dinner wager. :-)

Speaking of which, only a few more days and I have another one in the win column. I need it, too, because after the bath I took with Carl and Rick, and a recent loss to an ARRL HQ staffer over QRP DXCC, I am in a lobster-meal deficit. :-)

I built radios for 40 years as a n0-code SWL. Many of the old school SWL's without the means to buy good radios built them. I used to raid the local dump for discarded tv's and radios for parts (remember tvs with hv transformers and lots of cool tubes?) Learned code recently as another facet of SWL'ing, but decided to take the ham tests. Without ever taking a class or using any ARRL materials other than an old handbook, I passed the tech, general, and code. Missed the extra by one point. Almost choked on the code cuz 5 wpm is too slow...

> We have the right of worship and the right NOT TO.

If you do not want to that's just fine. But to remove from public areas
which were already in place since the country began and have significant
value for another is just plain wrong. How does the pledge go? "One nation
under God"? How about your money - "In God We Trust"... you know, if it is
that offensive to some liberals to have the word "God" anywhere, I will be
happy to relieve them of that *objectionable* cash :)

>
> I haven't seen any church closings lately or the FCC putting any of

If the majority liberals had their way, that would begin to happen to those
who spoke out against gays, abortion, etc.

>
> As for abortion.. I'm opposed to it, but not because of a religious
> doctrine. Basically I say, why is it murder to strangle an infant after
> birth, but perfectly OK to crush its skull, inside the womb?
> Seems bizarre doesn't it?

Yes it does, we strongly agree on this point. It's good to see that others
view it as wrong even without religious backing.

>
> And why do abortions take place? Because somebody wasn't being
> reponsible with sex!!

Again I could have not said it better myself. Personal responsibility is a
strong aspect of what conservatism it's all about.

>
> Now, I'm a liberal ? Do I sound like one ?

Not at all, initially you sound more conservative than some conservatives.
Which is why I have to ask, why do you subscribe to the liberal title since
you think more like a conservative?

> Well, I think Bubba Bush will be the worst president we've had in 40
> years.. but I could be wrong.

I think you will be pleasantly surprised, he will be a fine president for
the next 8 years.

For hams who like CW, it is a useful and fun mode. I think all hams
should try CW to see if they like it or not. It is not worth preserving
through governmental requirements. It is worth preserving within ham
radio if its merits support that preservation. I think it does. A Governmental
requirement not based on merit is just another form of welfare.

> When the clamor by those who would expand the voice segments
> to the maximum limit consider your statements, how then will you react?
> And what good could it possibly do?

My Dad said always to tell the truth. When those people discover that you
are lying about CW's capabilities, what do you think will happen? If CW
cannot honestly stand on its own merits, then it deserves to be replaced
by modes with more merit. Obfuscation about CW's merits will just hasten
its demise.

> And you clearly overlook the fact that some posters here clearly state
> that Morse code is long past usefulness and the implication is clear

You, personally, have alienated a number of hams to the point that they
would like to get rid of CW just to make you angry. If it weren't for
your (and others) viscous personal attacks, those same hams wouldn't
give CW a second thought. You (and other PCTA folk) are the worst
enemies that CW ever had.

Yeah, that does get really tiring after a while. It is always one of two things: "it was someone else's fault", or "we were wronged". I may sound condescending here, but my daughter stopped using those excuses when she was 11 after she realized it sounded... well... stupid.

Talked to a young fella on the repeater the other day who introduced himself by saying "my first personal is Jim and you're my first contact, QSL?".

He seemed like a nice sort, delighted that he had just received his shiny new call sign, and was anxious to make some new friends. Kinda sounded like I felt when I put my new call sign on the air the first time way back when, except probably brighter, cuz Jim is one of those young computer jocks. Me, I still got problems with the LL scale on my Pickett slide rule. Yep, I think Jim sounded brighter than me, quick to catch on to things.

But I don't think Jim will be back on the repeater. Before I had a chance to really get to know much about Jim, or even wrangle an invite to lunch, another station, with an impressive "senior" call sign joined the contact, flashed his shiny Radio Cop badge, and proceeded to issue Jim a "verbal speeding ticket" for improper lingo on the radio. "Radio Cop" said the term "personal" (and for that matter "handle") were unwelcome in ham radio, and that Q-signals were not to be used on VHF voice. Just generally made my newfound friend feel like an unwashed interloper. (Gosh, I've been saying "handle" since I was a conditional class. Slow to catch on, you know.)

Now I should point out that "Radio Cop" took pains to appear very well meaning. Didn't use any bad words that I noticed, was quite polite, even seemed like he was trying to be "helpful." In other words, he thought he was doing Jim a favor by pointing out his transgression from our sacred Amateur Radio way of doing things. I think Jim felt just the same way I did back in a new school in third grade when the well meaning teacher pointed out that "we don't keep our pencil behind our ear in this room." Sure enough, I looked around and none of my new classmates had pencils behind their ears. Sure was embarrassing, and at that moment I really wished I was back with my good old buddies in second grade. Now, if I'd been allowed to hang out a couple of days, I'm sure I would have learned how to properly stow my pencil. And if Jim would have hung around a couple of days on our repeater I just bet he would have noticed that his lingo, perhaps learned in another radio service, was a bit out of place, and pretty soon Jim would sound "just

like the rest of us." Like I said, he seemed pretty bright to me, quick to catch on to things.

"Radio Cop", you have kept our hobby uncorrupted. I heard Jim down around 27 Mhz this morning, and saw his ad on eBay trying to sell his barely used 2-meter HT. I'm gonna miss my new friend Jim, because I think I could have learned something from him. Maybe you could have also.

Like I said, he seemed pretty bright to me, quick to catch on to things. What do think it was that he caught on to about us from "Radio Cop".

That's asking someone to prove a negative. If the above folk had not
had Morse code forced down their throats, they would not feel the way
they do about the mode. Now the only reason they want to end the use
of Morse is to extract revenge on the PCTA folk. Morse code has become
more than a mode. It has become a religion on one side and a symbol
of religious oppression on the other side.

Message-ID: <944c30ndd1@sshuraab-i-1.production.compuserve.com>
Source record: 893

PS>Oh, and by the way, which of your opponents for Hudson Division Director
PS>made that quote which you paraphrased as:

"you know, there's no reason for Amateur Radio to be a technical hobby
today, simply because there's no jobs for engineers. You know, my father
was a plumber, and advised me to do the same. Looking back on it, you
know, he was right."

PS>?

PS>The individual who defeated you four times says that his father was not
PS>a plumber, and nothing resembling such a statement was made by him.

In that general context, the issue of making forthright statements, and staying
away from "cavalier, off the cuff" remarks during a campaign to avoid
unexpected disasters was, in the main, the subject of my letter to ARRL
during THEIR inquiry into "ethics" (and never forget, they came to me, not
vice versa).

>Perhaps exchanges with you in the past along these lines had motivated
>Gary Coffman, KE4ZV, to say the following:

>"Vince, you have provided essentially no documentation, merely a couple
>of one-liner out of context quotes that you repeat over and over, and a
>few paraphrased references to obscure documents you *claim* exist but
>refuse to properly identify or furnish. You are indeed not engaged in
>debate. You are simply spewing the same old propaganda, depending on
>repetition in classic Big Lie fashion, in an attempt to win your
>point. We aren't fooled."

If that were the case, Paul, you wouldn't even bother to speak with
me. Because you've spent all of your time trying to prove me wrong,
and not making it. Most likely, the fact that both you and Coffman did
extremely poorly in our exchanges explains your displeasure. The
'proof in the pudding,' though, is the end result, which predictions for
the Service were totally consistent with the documentation both you
and Coffman refused to accept. Thus I haven't see any great dispute over
that fact from anyone; just resentment. In the end, the Service was
caught short, as hams came to realize what had just happened to them.
That's why there's movement now (altho too late) to bring back some
Morse testing requirements, and a petition for reconsideration re:
theory exams. So in that context, the only statement that Coffman
was accurate about was his last, and that relating to the FCC:
"we aren't fooled."

Regards,
Vince, WB2EZG

Many hams don't even own an HF transceiver. When I moved
to CA in 1971, I didn't take an HF rig with me. All I had
was VHF access. I was without CW capability for 15 years.

Using exactly the same logic, automobile operators should be required
to wear crash helmets to prevent head injuries in many accidents.
It's called diminishing returns, Dick. There is a point where the
extra effort is not worth the return on investment. We have reached
that point with Morse code. The necessary return on investment just
does not exist anymore. And, no, making you feel good is not a good
enough return on investment to require Morse code skill of all hams.

Sorry Hans, if he can't take some criticism then he needs to go be a
priest or something. Thats the trouble today. No one wants to pay
their way anymore. Heck when I first got on AM phone I was made to
feel 2 inches high. You know, not enough audio, your too week, give me
a call when you grow up youngun.. etc.

It didn't run me off, I just dug in and LEARNED.

How high is it? Is it near other conductors or dielectrics? Questions
about the length of dipoles are in the question pool. What's wrong with
them?

> 3. Explain the difference, if any, between an AC ground and a RF ground.

Looks like there's a typo in the test question. A better question might be
to explain the differences between a DC ground and an RF ground.

The ARRL VE book, said, 1 fee for each test session, and it covered as many elements as the test taker wanted to take, or the VE have. But it is a new fee to retake a failed element. So as long as you keep passing you can do as many elements as you can pass for 1 fee. Remember though that most VE sessions have only 2 or 3 versions of a test element available and if you flunk all that they have, your done for that session.

As usual, someone ELSE makes an analogy and Lennie the Loser tries
to dismiss it as "incongruent". LENNIE is incongruent, but we are
having an excessively difficult time dismissing HIM.

>To be legal, one has to have an amateur radio license in
>order to transmit RF in the amateur radio bands...but the
>necessity to "solo" for an amateur radio license in not a
>federal requirement.

No...to be "legal" one only need be in the PRESENCE of a third
party who DOES have an Amatuer license of appropriate class. Even YOU
can operate on the Amateur bands without a license...you just have to
find someone foolhearty enough to jeopardize THIER license in doing so.

>>How long it would take to teach yourself is another matter. However I
>>once worked with a guy who was an avid simulator pilot that could
>>probably have soloed in 4 hours. he claimed several thousand hours on
>>his Microsoft flight simulator.

>The above is both incongruent, illogical, and rather absurd.

Gee, Lennie, in another post in this same thread you correctly
point out that the Wright Brothers were self taught in flying skills,
yet HERE you call it "incongruent, illogical and rather absurd" that
someone could solo in only 4 hours.

In 1982 or thereabouts a Marine Lance Corporal named Foote
commandeered an A4 Skyhawk at MCAS El Toro and took it for over an hour
joyride. LCpl Foote was an accomplish sailplane pilot however had
never flown a jet aircraft before. He had recently been denied flight
school in the Armed Forces due to an alleged inner ear disorder.

He not only flew a nominal flight profile, but he also shot a
flawless approach at NZJ. And this he did with only "simulator" time
in any powered aircraft, let alone a jet fighter.

Sorry I don't have the specific dates, however I am sure the
Orange County Register could find the specifics and verify them for you.

>As to self-learning radio arts, be they technology or operating
>practices, that can be totally self-taught.

The FAA currently allows "self-taught" persons to fly without a
license under Part 103 of the FAR's.

>In a career of design and development of radio and
>electronics, both myself and the vast majority of
>career contemporaries were "self-taught" on the changing
>state of the radio-electronics arts.

"But that was yesterday, and yesterday's gone". TODAY'S engineers
routinely attend continuing education seminars, as I can testify to
since I process many of the requests at my current employment. Seems
they don't feel as though possession of MSEE's and PhD's prevent them
from sitting in a classroom.

>There was no time to attend "formal schooling" or get "accreditation"
>through nice little paper certificates with grade points to attest to
>"qualified new skills." Myself and the vast majority of my
>career contemporaties already had formal schooling.

"That was all the education we needed and pooh on the rest"
Today's EE's find it counter productive to waste time reinventing the
wheel and attend appropriate update courses as needed.

>There were hardly any instructors or courses for each new radio-
>electronic art that evolved.

Seems the Armed Forces didn't have a problem sending us to schools
for just that event. You "commercial" guys couldn't find the time,
huh...?!?!?

>By comparison, the necessary knowledge to get an amateur license and
>to begin in the amateur radio hobby can be entirely self-taught.

True...any your point is...?!?!

>The amateur radio "solo" requirement is some flight of fancy, or
>rather a fantasy based on some "instructor's" aberrant self-
>professed "superiority."

And your continued derision of Amateurs is only further evidence
of your own "bruised ego" that your self-inflicted hatred has made
manifest.

Get a life, creep.

Sorry to bust up the No-Code kills (McDermott, KB1EVA) thread again,
Breaking news:

One of the men killed during this cowardly attack had a permit to carry
in NH; but was denied the ability to do so in Mass. because he wasn't
politically connected. Looks like Massachsuetts gun laws may have well
contributed to the death of at least five people:

"Source: Boston Herald (Letters)
Published: Friday, Jan 11, 2001
Author: David Bergquist

Louis "Sandy" Javelle was my friend. On Dec. 26 in Wakefield, he was
killed by a madman.

Sandy held both a federal firearms license and a permit to carry a
handgun in New Hampshire. Ironically, the gun laws in Massachusetts
prevented him from carrying a concealed handgun. But these same laws
did not prevent Michael McDermott from obtaining illegal firearms.

When the rampage started, Sandy told co-workers to lock the door behind
him and barricade it. He then confronted McDermott and became the third
victim. If Sandy had been permitted to carry a pistol, he could have
stopped McDermott. That meant that five other people could possible
have survived this tragedy. But Sandy did not have that option.

David Bergquist, Temple, N.H."

They maybe on the low end of the FCC's list, but the ARRL is interested in how many show up on 10m. Now with the creation of MURS they have an excuse to use opened up Ham 2m rigs, and most likely start to show up on 2m. I guess you figure if they don't bother you it must not be a problem for anyone else.

What's interesting to me, is the "vintage" of those "outraged". With a few exceptions they are usually not "old timers" or "newbies" but rather those licensed in the 70's through about 1988 or so. These are the ones who posture about "purity of the ham race" and look down their nose at any ham who "isn't like them". They are, by and large, products of the incentive licensing system with it's fragmentation of the hobby into exclusive ghettos, reeking of "status" and "rank" and "I can beep faster than you can beep".

When you and I got into this hobby, you got no special call sign, no special status, no special band segments, the callbook didn't show your class, and nobody could poke around the QRZ.COM website to check your "status". All of us, >ALL OF US<, exuberantly played in the ether as equals, and nobody gave a rip if you were a Conditional, General, Advanced, or Extra. You were a ham - PERIOD! I think that's what makes us old-timers more accepting of those who "don't act just like us".

73, Hans, K0HB

Well, somebody's got to do it. Why not certify an operation at a
local club? If people are serious about self enforcement, then get
the public backing of a club to pursue the nastiest cases the FCC
doesn't care about.

I agree with your assessment, Hans. I'm not fond of the idea either.
I figure that by insisting that club back the results, maybe some of
the frequency cops will see their limits and turn in their blue jump
suits and tin badges.

No, it's not a perfect solution. But maybe it's better than hiding
the problems under a rock, the way the FCC has over the last couple
decades.

The Los Angeles PD never used the "10" code. The only
non-plain-language "codes" were "Code 1" through "Code 7" and
they actually published a brochure detailing them.

The Los Angeles Sheriff's Department used a "nine" code.

The California Highway Patrol used a modified "10" code with
"eleven" code additions.

Made it interesting for us 50s-60s era police radio buffs
(before scanners were avaliable).

It's been a few years, but when I made General, I took the Tech,
General, and 13 WPM code at the same time for one fee ($6.45).
At another session I took the Extra and the 20 WPM code tests
again for one fee ($6.45). At the time, I was under the impression
that this fee went directly to the ARRL, to cover the cost
of the testing materials that they supplied. That ment that the
club, which was running the VE session, was really charging
nothing for their time.

Was I correct in my reasoning? Aren't they, the club, also allowed
to charge a small fee to cover their expenses?

> >
> > There was no question pool in those days.

Actually there was a question pool, but the actual questions and answers weren't available to the public. The ARRL Licence Manual and Ameco publications were study guides to give you an idea of what was required, and what to study. Many were paraphrased from the recollections of those who took the tests.

> > > How many times did you have to take the exams?
> >
> > Once. Other than blowing a few questions, it was pretty easy for me.

In the 70's you had to wait a year to retake the test. You would lose your Novice ticket if you didn't upgrade. These days I hear all the time of people taking the test numerous times. Really sad.

This all adds up to one big mistake. By lowering standards and force feeding numerous ignorant individuals onto the ham bands, how are we improving the standing of Amateur Radio? When I compare the technical discussions and considerate behavior of those who knew full well they could be heard everywhere, giving way to Hate and Discontent in order to impress a new group of listeners, who's going to want to (much less be savy enough to) save allocations in the future? I have seen Ham Radio Magazine die off and QEX almost die off. We used to have to fill out our own 610 forms, and we joked that it was a literacy test. Now that we don't have to do that, how many new hams won't even be able to read QST, much less give a S***?

We have to stop allowing ourselves to be re-formed for the wishes of "wanna bees".

Why does it make sense to allow criminals to have guns yet prohibit
law-abiding citizens the right to have a gun with which to defend
themselves?

I redirect this thread from r.r.a.antenna where it doesn't belong.
Jim, N2EY, is redirecting everything back to r.r.a.antenna where it
doesn't belong. That's the reason for the disconnect. Jim will not
admit that there ever has been a single code-tested ham using Morse
equipment for the purpose of jamming. He refuses to condemn code-
tested hams who use Morse equipment for the purpose of jamming since
he says there never has been any. That's because any admission of
such would violate the immaculate conception virginal religious
aspect of Morse code to the PCTA.

Just proves "we" don't want any truck drivers, janitors, garbage men,
or lawyers in ham radio. :-) However, the ham who gave me my first
exam-by-mail in 1952 was a lawyer.

didn't
> memorize them?

Memorizing these seemingly random "facts" is worthless (except for
frequency allocations and some regs) without deeper study. The test
questions are really easily performed signposts, designed to lead you
to further study along those lines. Much valuable knowlege can only
come through further research and investigation. The tests are like a
child's flash cards, helping you on to greater concepts.

If you go no further, you have failed at Amateur Radio.

Even cops often shorten the 10 codes to just the last number. It makes
sense if it takes less air time and the meaning is understood by all.
10 codes, although codes, actually become words in the users minds,
and like words often evolve with use...

Nope, it's not and I speak from experience. I memorized those random facts and that same framework later served me as an outline for knowledge in electronics. I still fill in the blanks as needed.

Like I said, an outline to future knowledge.

> If you go no further, you have failed at Amateur Radio.

Lots of people fail at lots of things. Some people failed at amateur radio because they were chased away by hams requiring perfection in beginners. Some simply lost interest. What's wrong with live and let live?

>
>Was I correct in my reasoning? Aren't they, the club, also allowed
>to charge a small fee to cover their expenses?

The ARRL VEC allows the VEs to retain a portion of the fee (up to $4 of
the current $10 fee, which is per session, not per exam) to cover
expenses if they wish to do so (this wasn't originally the case). The

ARRL requires that records of such expenses be kept, although the FCC no longer requires reporting. The FCC also no longer specifies the maximum amount which can be charged (there never has been a minimum). ARRL/VEC is charging $10, but others may charge more or less; the marketplace will probably decide.

From the ARRL letter, December 15, 2000:
==>FCC OPENS DOOR TO INCREASED TEST FEES FOR 2001

The FCC has suspended its regulatory limit on the reimbursement fee for Amateur Radio examinations, and the ARRL VEC says a new $10 test fee will go into effect January 1. An FCC Public Notice released December 4 explained that the Commission did not plan to announce a maximum reimbursement fee for 2001 since the requirement to do so no longer appears in the Communications Act.

For now, the FCC says, it will suspend enforcement of the fee provision, ?97.527(b), which continues to appear in the FCC rules. Some, if not all, of the nation's other Volunteer Examiner Coordinators are expected to follow suit, although at least one VEC charges no test fee whatsoever.

ARRL VEC Manager Bart Jahnke, W9JJ, says the ARRL VEC's current fee of $6.65 was based on the provision in the Communications Act, adopted in 1984, that established a $4 cap on reimbursement of out-of-pocket costs with an annual adjustment based on the Consumer Price Index. The new, higher fee reflects the fact that the ARRL VEC is doing more of the work on behalf of the FCC than was originally envisioned when the provision was included in the Communications Act. That effort includes data entry for all new and upgrade license applications once done by FCC staffers.

ARRL VEC volunteer examiners will continue to charge applicants $6.65 through the end of 2000.

>the problems under a rock, the way the FCC has over the last couple
>decades.

Lawlessness and vigilantism is never a solution. One cannot
undo the past to correct peceived mistakes or perceived "rocks."

Consider that CB users outnumber hams by at least 10:1 and
there are more big rig drivers among the CB users than there

are hams. Starting some vigilante movement against evil CB users and worse-than-evil freebanders might result in another big rig crash such as in Sacramento, CA, by one frustrated ex-felon who killed only himself and made a mess on the steps of the California Capitol Building. It served NO purpose.

There is no time machine to go back to undo the past. There is the possibility that the existing and future FCC can solve some problems in US civil radio. Support the FCC in regulation of radio...or become lawless vigilantes who are outnumbered by others. There is no honor or respect in vigilanteism.

I think that's a pretty good assessment of our current exams. The tests are 1.) valid; 2.) provide some degree of confidence that the examinee has absorbed at least a minimum level of information; and 3.) the examinee won't pass the test if he doesn't exceed that threshhold.

Unfortunately, Dick seems to want to make his personal knowledge level into
the desired threshold. The threshold should never be below his knowledge
level whatever that happens to be at the time. He doesn't seem to realize
that that approach will guarantee that all hams are superior to him which
is not hard to visualize at all.

(Don't choke, Len) I agree. We need to put some teeth in present FCC regs and let THEM do the enforcing. However, just like your local police occassionally need extra eyes and ears, so does the FCC need people out there providing them with assistance and information. They can't be everywhere all the time.

Also, it doesn't hurt ANY radio user to be proactive in community issues, especially where education of "lay" users and consumers is important.

Len, I guess I can understand your resentment towards those that obtained a formal education. The fact is many have neither the ability or the self discipline to learn on their own. They are not blessed with your tenacity and innate intelligence.

The problem with being self taught is you have someone as ignorant as you for a teacher.

One wonders if a self taught instant extra has even considered the safety issues associated with high voltages and mechanical supports.

I suffered through a formal education that pointed me in directions I would not have even considered. Things that I would have discounted on my own as being useless, I admit some where, but many came to be of valuable use in latter years.

While your opinions of my stances were read and enjoyed, as always I disagree with you.

Probably the same moral outrage that causes all you Yankees to get your panties in a wad when you see a Confederate flag and scream KKK!

People have a tendency to assign values to something symbolic rather it is accurate or not!

I still say "handle", I used it a long time before any CBer used it, and the use by a CBer or anyone else does not obviate me using it.

Look at the term "Good Buddy", some where along the line it got changed from an unknown friend on the CB airwaves to a derisive term implying homosexuality.

Who is the grand guru of symbols that assigns these meanings?

I think in your haste, you may have misread my post.

I'm talking about a monitoring station run by someone who knows what IMD is, who knows how to DF a signal and determine source, who knows how to measure frequency and bandwidth, and most importantly who would have an opinion which a court of law could recognize. That's all. The purpose would be strictly to act as witnesses for prosecution of offenders inside the amateur radio bands.

Prosecution would still have to be done by the FCC. The difference here is that at least they wouldn't have to use valuable time at a monitoring station.

I really don't want to be drawn into your argument about how lovely someone swing is or isn't. I simply wanted to comment on your use of the word sterile. A lack of a swing is not sterile code. I would simply like to understand your negative attitude about properly timed code.

Phil, you are absolutely correct on these. I was an Extra in 1966, and got in on the second window in 1976 for a callsign. BTW, there was a one-time $30 fee for selection of a personalized callsign. We are not defined as "vanity" calls now however. That window is long forgotten by the FCC.

At one time that was completely correct. I ran a DeVry/Great Lakes core from 1984 (before League involvement, by the way) through 1993. At first the local core didn't get anything, but eventually DeVry/Great Lakes started a core reimbursement progam. By the time they folded and we changed over to ARRL, the League was reimbursing up to $4 to the local core.

> That ment that the club, which was running the VE session, was
> really charging nothing for their time.

Also correct. That's why we are called "volunteer examiners." My club, however, covered all my costs for materials since I prepared all of our written and code exam materials and purchased or prepared other materials such as blank paper, pencils, 610s, etc.

> Was I correct in my reasoning? Aren't they, the club, also allowed
> to charge a small fee to cover their expenses?

Not at the VE Core level. Only at the VEC (coordinator) level. And when a VEC does allow expenses to be covered by a core, it's always as a rebate from the VEC (I speak from DeVry/Great Lakes and ARRL experience only).

I'm sorry you had that experience. I can't answer whether a VEC can instruct their cores to charge for each element. I can say that ARRL does not, nor did DeVry/Great Lakes when I was with them.

Who was the VEC for your exam? I have my own suspicion, and if I'm correct it's further confirmation of why I will never have anything to do with him.

Irrespective of who it is, it's an example of poor training of the VE team. That's one of the things that should have been basic in their instruction. I suggest you write a letter of complaint to the VEC.

They've been on the low end of ten for eons when the spots are up and I've been there, too. Right off most of those who are audible here are Central and South American stations which nobody in this country including the FCC or the ARRL can do anything about. I've never had a problem working either thru or around them with 100 watts worth of cw, they're just some more ignorable garbage on the ham bands. I'd sure as hell rather have to deal with a freebander on ten for a new one than I would have to deal with Radio Moscow for a new one on 40.

Indeed and agreed. Probable factoid: The FCC would much prefer dealing
with some inane but basically harmless freebanders than they would a
phlanx of amateur (in the more common sense) "helper" frequency cops up
their butts.

>code.

Jim,

I don't know how much plainer I can make this! It sounds like robots
talking to robots.

Machine-perfect code is just fine for sending recorded traffic, navy
messages (way back then), and other similar "formal" uses. Just like
police dispatchers speak in monotone automaton fashion.

But when I'm in casual conversation on the airwaves, with another human
being, enjoying the art of Morse, I want it to have character, inflection,
and contextual emphasis.

If you don't agree with that attitude, don't answer my CQ, because you
won't be treated to "properly timed" code. Hopefully that doesn't make
me a bad person, but I'm sure Brian will call me a jerk anyhow.

I guess it's a matter of semantics. Retests of failed elements are, for
paperwork purposes, considered separate sessions (or sittings).

The ARRL/VE Manual says "The ARRL/VEC charges $6.65 per candidate, per
session." Of course, that was published before the fee increased to $10.

The original poster said they were going to charge for each exam (element),
which is inappropriate.

A vigorous attempt is to be made at the Cairo Conference to take the present 160meter band away from the amateurs. Our prized 40-meter band is the goal of other interests. One of the more-important commercial radio executives recently said to this writer-"the amateur will eventually find his resting place in the five-meter band, unless he is aggressive enough to fight for the privileges he now enjoys."
The cry of this magazine has been for aggressive leadership! Look to Congress for leadership . . . to pull us out of the sea of difficulty. Congress can help us get some amateur-minded men on the Delegation to Cairo. And, while we are at it, why not ask President Roosevelt to put a couple of good amateurs on the FCC, if only in an advisory capacity without any cost whatsoever to the Government? We know of many good men who are anxious to serve!

Political Editor - December 1934 Radio magazine

There's lots of accidental jamming because of mail boxes. I suspect all
modes are used for jamming at one time or another. I once heard someone
playing music using FM on 3950.

They'll have to be web savvy and take care of biddness via the FCC ULS
page. It's complexity goes beyond a mere literacy test.

> We have to stop allowing ourselves to be re-formed for the wishes
> of "wanna bees".

>
> Jim, ac6tk

Jim, I wish I could agree with you over the last 2/3 of your message, but I see things differently. I give a S***, yet I am dead set against unnecessary government regulation and interference in my life. I am for a simplified licensing structure, and have advocated ONE amateur radio license of about the level of General. I will support a simplified entry level license, with reduced privileges.

Behavior problems should be met with a nice letter from Riley. Followed by a big stick.

Ed:

You betcher bippy I know what it means. And what it doesn't.

When you take a driver's test you 1.)take a written test and 2.)take a
practical operational exam where you demonstrate that you can actuall
drive the darn thing.

When you qualify as a pilot you 1.)take a written test, and 2.)take a
practical operational exam where you demonstrate that you actually can
fly the darn thing.

When you take a ham radio test you 1.)take a written test and 2.)take a
practical operational exam where you demonstrate that you can actually
copy code.

In neither case is one exam "emphasized" over the other. You have to
make a passing grade on both. It's called MEETING THE REQUIREMENTS FOR
THE LICENSE!

All the whiners are still at it just a loudly as though the 5wpm code
test actually amounted to something. Whatta joke!

You talk like you and everyone else posting here in support of totally dropping it are its friends. What an idiot.

739. The loss of 11 meters...

Newsgroup: rec.radio.amateur.policy
Date: 2001-01-18 04:01:22 UTC
From: Aaron Jones <nomail@nomail.com>
Message-ID: <b4qc6tg7g566ts0k7og7tf3m368d0f3s1i@4ax.com>
Source record: 989

September 1958
Excerpts from FCC comments for removal of the 11 meter amateur band:

Reallocation of frequencies in the range 26.96-27.23 Mc.

The Notice of Proposed Rule Making in this proceeding recognized a need for additional spectrum space for personal use by any individual, especially those persons now holding authorizations for Class A stations in the Citizens Radio Service who will not be able to establish eligibility in any of the Industrial or Land Transportation Radio Services, as well as a substantial need for additional frequencies in the 28 Mc. range for use in the remote control of such objects or devices as model aircraft. Accordingly, it was proposed to reallocate frequencies in the band 26.96-27.23 Mc. from the Amateur Radio Service to the Citizens Radio Service for use by Class A stations for general purposes and, in addition, provide certain other frequencies, to Class C stations exclusively for the purpose of remote control. The Commission stated that this reallocation appeared appropriate because the frequencies in this band are a part of a larger frequency band within which interference may normally be expected and must be accepted from industrial, scientific and medical (1SM) devices and because, as a result of the foregoing, only limited use of this band has been made by the amateurs. In addition, it was pointed out that amateurs, as individuals, would be able to obtain licenses in the Citizens Radio Service for either radio control or voice communication in this band.
In connection with this proposal, the Commission received a very large number of comments from both individual amateurs and modelers, as well as clubs and organizations representing persons active in each of these hobbies. In general, it may be said that all but a few comments from modelers enthusiastically supported the proposal and most of those from persons who are both amateurs and modelers also supported the reallocation. Most of the comments from other amateurs were in complete opposition to any use by the Citizens Radio Service of frequencies in this band. However, a substantial number suggested that the band be shared by the Amateur and Citizens Radio Services. A few amateurs suggested that other amateur frequencies be substituted in lieu of those proposed, or concurred in tile proposed reallocation.

Typical of the reasons set forth by the amateurs opposing deletion of the availability of frequencies in the 26.96-27.23 Mc. range to the Amateur Radio Service are:

(a) The adoption of the Commission a proposal would constitute a violation of the Atlantic City Radio Regulations to which the United

States is a signatory nation.
This band is the only one in the lower frequency ranges open to the amateurs where the Commission permits certain types of emissions and operations, and accordingly where the amateurs may engage in experimentation in facsimile, continuous carrier, and duplex operations.
(b) The characteristic which make these frequencies particularly good for long range and international communications will cause too much interference from skip, and prevent the widespread use of this band for short range communications and remote control.
(c) The recent non-use of this band by amateurs is due to cyclical "sun spots".
(d) Other amateur bands are overcrowded, the service is expanding at a rapid rate, and the 26.96-27.23 Mc. band is the only area left for expansion.
(e) The fact that an amateur might obtain a Citizens Radio Service authorization is not an adequate substitute because some amateurs could not meet the age requirement of that service, and in addition, amateurs would not be permitted to make their own adjustments to a citizens radio station.

On the other hand, the modelers point out their dire and immediate need for additional frequencies, stating that the situation has been aggravated by recent authorizations of high-powered stations in other radio services on the frequency 27.255 Mc. for such purposes as traffic controls and remote radio paging. They further state that the use of frequencies in the 26.96-27.23 Mc. band for control of models is feasible and is similar to allocation practices found practical by other governments. The Commission is well aware of the history of the Amateur Radio Service in the development of the radio art and in providing a springboard of interest for future engineers and scientists. However, it must also be remembered that the remote control of models fosters a similar interest in young people and is a hobby in which young people are able to participate. The Commission is aware of the Amateurs outstanding record of assistance in local and national disasters. The Commission also recognizes that the Amateur Radio Service is a rapidly expanding service, but then, so is tile number of persons engaged in the remote control of models expanding at an ever increasing rate. While both amateurs and modelers suggest that spot frequencies located in different portions of the spectrum might be more desirable for remote control, such allocations are simply not possible at this time with the present scarcity of spectrum space.
In addition to filling the need for additional frequencies for remote control purposes, the proposed reallocation would also fill all urgent need for additional frequencies for voice communications by persons who will be unable to establish their eligibility in any of the Land Transportation or Industrial Radio Services, Although the Commission may have originally underestimated the use of the 26.96-27.23 Mc. band by amateurs, the use of that band is still considerably less than in other bands available to the amateurs, a fact which is admitted by

many amateurs and established by monitoring observations of tile Commission. As to whether the proposed reallocation would be in violation of the Atlantic City Radio Regulations, the Commission considers that no violation is involved. The primary world-wide allocation (if that frequency band is to the Fixed and Mobile Services and the footnote permitting its use by amateurs is merely permissive. Therefore, the reallocation ordered herein and in the companion proceeding in Docket No. 11959 from the Amateur Radio Service to the Citizens Radio Service is not in violation of the Regulations.
.As stated above, the 26.96-27.23 Mc. band is a part of a larger band in which interference may normally be expected from ISM devices. Most of the reasons presented in opposition to the proposed reallocation of that band to the, Citizens Radio Service were based upon potential use of this band in tile future by the Amateur Radio Service instead of actual need or existing use of the band. Monitoring records indicate that this band is not heavily used by the Amateur Radio Service, due obviously to the interference hazard presented by the operation of ISM devices on 27.12 Ale.
The Commission feels that substantially greater use can be made of this band by the Citizens Radio Service and that the loss to the Amateur Radio Service is negligible. While it is true that certain operations have been possible in this band which were not permitted on lower frequencies available to the Amateur Radio Service, such operations are still possible on frequencies above 51 Mc. and frequencies in those ranges appear to be coming into even greater usage by the amateurs than the band here under consideration. Although the Commission realizes that, in many cases an authorization in the Citizens Radio Service may not be an adequate substitute for the Privileges lost in this band; nevertheless, the Commission finds that public interest, convenience and necessity requires the reallocation of the 26.96-27.23 Mc. band to the Citizens Radio Service for the purposes proposed. The recommendation that this band be shared by the two services involved is not adopted, since that action would be inconsistent with the Commission's position in international affairs regarding the shared use of amateur bands.

Now we're getting into an area I can speak about.

As any self respecting Chicagoan (and the environs) knows, a slider is a small square hamburger with a pickle and onions that is only purchased and eaten in quantities of 5 or more. Fries and onion rings are NOT optional, they must be consumed as well for the full effect. And that effect probably is what gives them the name "sliders."

Oh, I guess their real name is White Castle. I don't think that's a pronouncable word, however. Everytime I've heard someone try, it comes out "sliders." TAKE HOME A SACKFUL is their slogan.

Anyone having to live somewhere besides Chicago (and the environs) is comforted by the fact that they are available frozen in many other areas of the country.

So do several departments in the western suburbs of Chicago
(combination of 10 sigs and Codes 1-7).

In Metro Dade County, Florida (Miami), they use Q signals.......on
voice.

Harrumph.

The poor kid is sure to have a rough life, what with being too ignorant to grasp a new procedure in a new environment, then being put off so easily when gently corrected. What *is* this new generation ever going to amount to, anyway?

Why should they? Another few questions and they had Tech Plus with all
Novice privileges plus 2 meters and up. With such a convoluted
licensing system, no wonder the Novice class faded away.
There was a time when FCC bothered to find out what they could expect
from changes to be made in ham radio before they made them. Somewhere
along the way that went by the way. Right along with retirements, I
suppose.

Here I agree with you Ed. Perhaps this was because of the Morse exam, which might be considered ancient and snail-like by modern youngsters... but I believe it is also because ham radio, even without a Morse code exam, is considered old hat by those who are already using cell-phones and capable of brousing on the Internet. In my opinion we should not have abandoned the Novice concept because of the response that the Novice entry was getting....Instead we should have made a more modern Novice entry, including a test where high school techies could show off all that they were learning with regard to computer operation and modern personal communication. Maybe if the ITU won't eliminate the CW HF requirement...the Novice license should only grant VHF and above privilages...but when the ITU eliminates CW requirements some HF privileges should also be granted...not just so future Novices could practice Morse code...but so they could get some taste of HF DX SSB. At any rate the present license structure is not set up to allow entry in a way that it can compete with non-licensed communication. At the other end... the highest class of Ham license (Extra Class) can not qualify anyone as a modern communications maven.

Three classes of license can not fit all; Can not provide motivation for easy entry; Can not indicate the value of advanced Hams to the USA! The present structure can only serve to satisfy OT hams who do not want to be tested on modern communications methods and are only interested in retaining their existing privileges;...it can not attract new blood as it appears to be too difficult for beginners and much too easy for advanced modern communication experimenters. Without lots of eager beginners, as well as knowlegable techie experimenters, the future of the hobby is doomed...

UNLESS...Hams get MORE license classes and official FCC technical
endorsements.

Thanks for your comments Ed...I know that you mean well....BUT haven't
YOU noticed?

I'm an art student with no radio experience who needs to buy an FM transmitter for a project he's working on. I have this metal box with an FM radio inside it. It picks up all local stations fine, even inside the metal box. For my project, I'm trying to broadcast digital voice from my computer onto an FM frequency and into the box. I spent $30 on a transmitter from Radioshack, and it worked so poorly that I could barely pick up the signal even when the radio was outside of the metal box. I don't want to make this mistake again.

Keeping in mind that I can't build a radio and that I need an FM transmitter with a stereo jack on it (so I can hook it into my computer), does anyone know of a cheap solution to my problem? Or if this isn't the best usenet group to post this in, can anyone point me to a more appropriate one?

I forget how many 10 codes there are/were on the "official list" but I think it's around to thirty of 'em. 40? Looney-tunes. All they do is tax memories and generate mistakes and confusion when you least needed either.

>
In the mid-70s I set up a passive CB-equipped neighborhood Townwatch security association and created a completly non-standard 10 code list of about 12 codes which still works well. Those codes don't go any farther than routine operations, mostly to avoid spilling the beans about when the patrols are or are not "on the street" or where they are, etc. All other comms are plain language per all police operations in the Philly area I've heard. I've noticed that the locals are also packing cell phones these days, that oughta cut down on problems with the scanner nuts.

>drive the darn thing.

The present testing for Morse code is analogous to my driving test determining only if I signal correctly. If I fail to signal correctly, I don't get my license.

If you really believe that Amateur Radio testing requires practical testing, you would advocate a wide range of practical tests that test the ability of the applicant to operate a wide range of modes.

Did your comments to the FCC ask that they give practical tests in setting up a station, selecting a radio, operating modes other than Morse code, etc? If not, then, IMHO, you are seeking only to keep Morse code testing and a "practical operating exam" has nothing to do with it.

I'm sure you know this.

And those threats did actually surface, again and again over the decades. It was only by addressing them at the international level that Amateur Radio retained its spectrum.

Don't just look to VHF and up for spectrum threats. There are HF allocations on the plate now, both with new spectrum being sought and with spectrum under challenge. Even 40 meters is once again going to be considered. The goal is, of course, to get an exclusive allocation near 7 MHz, but this may not end up quite as good as it sounds. How would you feel if that exclusive allocation were 200 kHz wide? I can tell you, the European hams would claim great victory, of course, going from 100 kHz to 200 kHz, but in the US, we would "lose" 100 kHz if that came to pass. IMHO, we are better off if it happens, because I can't make much effective use of spectrum above 7.1 MHz anyway; if 7.1-7.2 were cleared of broadcasters, the band, IMHO, would be "expanded."

Of course, if it did come down that way, we would hear from the doom and gloom contingent pretty quickly. :-)

Something I consider when working search and pouncing in the SS contest. Those stations who did not answer my QSL requests from years past do not get my time for another contact.

I am sure this applies to DXers, too.

I didn't listen to the bands for a few weeks before using my Novice ticket. The day it showed up in the mailbox, I sent my first CQ and made a few contacts.

The "gaff" could have been avoided if everyone had decided that it wasn't a big enough deal to be labeled a "gaff" in the first place. How was he to know that he might face criticism if he didn't choose the correct words when he introduced himself to people? Let's see, after a few weeks, he MIGHT have figured out that "handle" was okay if he was talking to an old timer, but a newcomer might think he used to be a CBer, and he MIGHT have been a freebander, so he should ....

At any rate, I hope he received a warm welcome to our community instead of a lecture.

After someone obtains a degree, if they are successful in their chosen field,
they all spend a lifetime being self taught.

A very few people cannot learn anything on their own, but they are not likely
to be hams.

>> A "No Coder" is jamming you on 40m SSB?

>Well if a "No licenser" did it what's to stop a "No coder"?

Did the person identify so you could determine whether he or she had a license or not and whether they had passed a code test?

Would the jamming have been aceptable to you if you learned it had been done by someone who passed a code test?

>That's asking someone to prove a negative.

It does not need to be proved to me that there is someone, somewhere that would like to see Morse code use on the bands ended.

I have seen a few diatribes here against Morse code. Even if one feels it is a mode that offers no redeeming value (I disagree), their discussion of same does not mean that they necessarily feel its use should be outlawed.

We CAN look to the comments made to the FCC, because I don't think that we can infer that those who say here that they think Morse code should be outlawed are necessarily serious. Lacking any evidence to the contrary, I think it quite likely that those statements were made more to stir the pot than to be serious. If those saying they believe the mode should be outlawed were serious, they would have made their views known where they could have an actual effect.

Probably about as close to "proof" as we can get, Cecil. Is it at least "a preponderance of the evidence?" This is a "civil" debate, so we don't need "beyond a reasonable doubt."

Ed:

As long as the "incentive" isn't attached to making a dedicated effort
to learn and master a practical communications skill, eh?

>The biggest problem I think we face, Larry, is one of spectrum. That will
>be solved as much by useage of the bands as it will anything else. Let me
>turn the question around and ask you how having a multi-WPM test series will
>solve that problem?

Apparently, it could do a lot more than merely giving away HF privileges.
So far, Restructuring has been a colossal flop. Sure, there was a lot of
upgrading activity, with people taking advantage of grandfathering. But
the total numbers of new hams has, to date, been shockingly low.
Therefore, one could draw the conclusion that easier licensing requirements
aren't the answer to our situation. I think the answer is that ham radio
in the USA is about as big as it's ever going to get, without a national,
major media advertising campaign to get the word out about what we do.
Again, I say -- word of mouth, hams "talking up" ham radio in their local
area, IS NOT ENOUGH -- and never will be. For the most part, all hams
do is talk to other hams -- "preaching to the choir" as it were.

>Another problem is that we are not seen as being relevant by many in
>industry and at the FCC. How will having a multi-WPM test series solve that
>problem? IMHO, this is the most important reason to replace the Morse code
>tests with tests relating to newer technology.

Uh, don't look now, Ed, but Morse code testing, at as many levels
as you like, and "tests relating to newer technology" are not mutually
exclusive! Why does one have to be eliminated in order to implement
the other? I want a full explanation for that, Ed. Answer that question.
Why does testing for knowledge of a practical manual communications
skill prohibit the updating of written tests to reflect technology advances --
or vice versa?

>When the no-code VHF license was introduced, there was a sudden influx of
>newcomers for which there simply was not sufficient Elmering. How will
>having a multi-speed code test series solve that problem.

I'll answer your question that answered my question with another question: Why is "Elmering" so essential? I became an Extra-class licensee under the "old" system with virtually no one-on-one "Elmering" whatsoever. I knew how to open a book and read it, and that's what I did. I've offered my services as an "Elmer" many times in the past, but one requirement I made was that the books must first be opened up, and read. Sorry, no sale. What the "elmerees" wanted was to be shown the right button to push to make the radio work. I said, "OK, open up your instruction manual -- it'll tell you in there!" "Waaaaahhh!! Don't wanna read and learn anything --- wanna talk on radio!! WaaaaaHHHH!!!"

>I see the petty bickering that is taking place here and elsewhere and the
>sour grapes and/or gloating as being harmful to the amateur radio service.
>How wil having a multi-speed code test series solve that problem.

What are the sour grapes and gloating about? Mainly, jealousy over certain accomplishments certain hams have made, and the fact that making the same accomplishment would require the person with the "sour grapes" to get off their collective duffs and do the work necessary to make that achievement for themselves! I'm sure I'm considered to be "gloating" merely for having a 1x2 callsign -- I've already been told as much by certain local hams. I'm sorry I'm not "politically correct" in the eyes of the slouchers, Ed. I'm sure you'll do your part to make up for it.

>What problems do you think are facing the Amateur Radio Service and how do
>you think having a multi-speed code-test series will solve them?

I think the problem we have in Amateur Radio is that we've lost track of traditional values, as we have in virtually every other aspect of our society. I don't think multi-speed code test series will solve that, but the fact that the code tests are a main part of the "problem" for the slouchers places them at the locus of concern. If getting an HF license required the learning of a foreign language, and testing for fluency in same, then THAT would be the issue. The whole thing revolves around the laziness of people who want privileges without making the effort to learn practical skills in order to earn them. Solve that, and this newsgroup will come to an end.

>ARRL policy makes me want to vomit.

Watch out, Vince! Now Ed's gonna ask you several questions, each ending with: How is a multi-level code test going to help?

Naturally, you're correct. Ham radio is heading down the drain, particularly with regard to it's attractiveness to young people. The irony is, young people used to be attracted to ham radio by the very thing that the middle-aged white men don't want anything to do with -- the Morse code! Kids love learning the code, they make a competitive challenge out of it, and, if given a chance to use it on-the-air, usually become experts at it in very short order. The requirement to learn the code doesn't keep young people away from ham radio -- the overbearing, overwhelming negative influence of middle-aged white men does! They get on the air, and all they get to discuss -- on voice or CW -- is the health and welfare of the individual at the other end of the QSO. There is little original discussion of events, new ideas, science, music, the arts -- the talk is usually all about the person doing the talking, as if he (usually male) were the center of the universe. When young people get together to chat, they rarely talk about themselves. That's why the typical CW QSO, consisting of call sign, name, QTH in Florida, age, how many years retired, local WX report, and "Got to QRT to get to the Senior Center for the free lunch" just don't cut it with young people who are curious about amateur radio. The ARRL's dumbing-down policies are pandering to more of this. Young people don't need reduced licensing requirements -- just a less "lame" ARS!

I'll never forget my worst incident with a "radio cop." I had encouraged my wife to get her license. Since she knew absolutely nothing about radio before studying for that exam, and had studied for three weeks to pass the exam, that license was hard earned and she was darn proud of it.

Anyway, part way through our second conversation on the radio, the "radio cop" made his grand entrance. The previous night, my wife had problems getting her radio set up to work correctly (it was my old radio - purchased because it was loaded with features, not because it was necessarily easy to use). So our conversation was somewhat limited that night.

However, the next night, I had set the radio up to default to an easier mode (preset memory channels), so that we could concentrait more on conversation (figuring she would eventually learn the radio eventually on her own).

Anyway, that night, we tried several of the memory channels (each set to a different repeater), trying to figure out which repeater would be best for her to talk on during her trip to and from work each day (which repeater had coverage of the whole trip distance).

Finally, we settled on two memory channels - the main one and a backup (which would be set to memory channels one and two on the radio). As we were discussing this, a male voice boomed in with the words, "frequencies, not channels." Believing that someone else might want to use the repeater, I told my wife to hold on a second and invited the person to go ahead.

At that point, the "radio cop" started lecturing my wife about how we use frequencies instead of channels in ham radio and further suggested that she should also stop using CB slang (she had said "roger" earlier).

When he was finished, I explained that we were referring to the memory channels on her radio, that she was new to ham radio, that my goal was just to get her talking on the radio at this point, and that little issues like that could be corrected later.

In response, he pointed out that radio memories were nothing more than memorized frequencies, that I should refer to the frequencies memorized

instead of the memory channels, that I was failing my wife by not teaching her properly from the beginning, and then turned back to lecture my wife some more, ending with a suggestion that she find someone better than me to teach her in the future if she wants to learn how to do things correctly.

After he was finished, I thanked him for his input and tried to contact my wife again. She simply said that she was almost home (she wasn't) and that she would talk to me when she got there.

It took me almost four days to get her to talk on the radio again, and then only on a frequency that I was able to assure her was not likely monitored by anyone else. And, dispite our almost nightly conversations, it was going to be another five months before she would be confident enough to talk to someone else. In fact, to this day (almost two years later), she has only talked to two people, besides myself, on the radio. And her enthusiasm about, and pride in, radio are long gone.

In the end, the "radio cop" did a good job of defending "proper" tradition on the radio. But in doing so, he ruined my wife's enjoyment of this hobby (and, for all practical purposes, ended her hobby before it even got started). And that is why I'll never forget that "radio cop."

>From: yodoc@aol.comnospam (Larry Roll K3LT)

>As long as the "incentive" isn't attached to making a dedicated effort
>to learn and master a practical communications skill, eh?

As long as the incentive is directed toward what I believe will help further the long-term goals of the Amateur Radio Service.

>So far, Restructuring has been a colossal flop. Sure, there was a lot of
>upgrading activity, with people taking advantage of grandfathering.

You believe that people learning new things and passing new tests is a "colossal flop?"

>But the total numbers of new hams has, to date, been shockingly low.

A slight increase, reversing a trend that had been a slight decline.

>Therefore, one could draw the conclusion that easier licensing requirements
>aren't the answer to our situation.

I absolutely agree; the problems facing the Amateur Radio Service will not be solved if only we could test hams in just the right way.

> I think the answer is that ham radio in the USA is about as big as it's ever
> going to get, without a national, major media advertising campaign to
> get the word out about what we do.

Although I disagreed with you that prime-time TV advertising was needed, I agree that Amateur Radio, and ARRL, need to do a better job promoting ham radio. However, I wonder what percentage of those that might be interested in ham radio, but have not yet taken any tests, are not aware of its existence? Probably few. I do imagine that a lot of those who are interested are already hams. We might gain a significant number if we got the word out better about restructuring.

>Again, I say -- word of mouth, hams "talking up" ham radio in their local
>area, IS NOT ENOUGH -- and never will be. For the most part, all hams
>do is talk to other hams -- "preaching to the choir" as it were.

I am much more likely to buy a product if I get good word of mouth about it than if I read an ad. Unfortunately, the word of mouth at this point may not be very good. Ever since I did it, our ranks have always had a high percentage of people whose first personal experience with radio was on 11 meters. The 11-meter folks of that day looked up to hams, and felt that if they became hams, they would be doing a better version of what they were doing at the time. How about today? I have read some of the CB newsgroups, and talked to a number of CBers. Do you not think they might resent the use of "CBer" as an

insulting term within ham radio? Do you think they are not well aware that if they join our ranks, a few curmudgeons will go out of their way to tell them how dumbed-down they are because they took these new exams? Do you think our reputation for "gently reminding" them that they must choose exactly the right words when the join in amateur conversations would help bring in these newcomers.

I will believe your sincerity about wanting to bring in newcomers to ham radio with mass-media advertising when I see your personal conduct reflecting the same desire.

>Uh, don't look now, Ed, but Morse code testing, at as many levels
>as you like, and "tests relating to newer technology" are not mutually
>exclusive! Why does one have to be eliminated in order to implement
>the other? I want a full explanation for that, Ed.

Yes, you usually do want a full explanation, Larry. :-) You are correct, Morse code testing and relevant testing are not mutually exclusive, but I do not believe that Morse code testing adds to the perceived value of Amateur Radio outside of some amateur circles. I do not want to eliminate Morse code testing in the Amateur Radio Service, btw; I believe it should continue to be part of our testing process as long as it enjoys significant popularity on the air. I just believe that it should be tested as is the testing for other modes -- by including the questions about sent text as part of the overall exam.

>I'll answer your question that answered my question with another
>question: Why is "Elmering" so essential? I became an Extra-class
>licensee under the "old" system with virtually no one-on-one "Elmering"
>whatsoever.

Yes, but Larry, you are so far advanced over mere humans that you can do that. I did not. If it weren't for W1BNB, I don't think I would have been nearly as successul at setting up and using my station. I think, however, the real reason that I believe Elmering to be important is that we can see the evidence of lack of Elmering in the low activity rate and probable low renewal rate of the Technicians who entered ham radio right after the no-code Tech was put into place.

>I knew how to open a book and read it, and that's what
>I did.

If you agree that opening a book and read it is adequate to obtain the practical knowledge that is passed along by Elmering, perhaps you could consider advocating opening a book and reading it as a good way of obtaining the practical knowledge of Morse code use...

>WaaaaaHHHH!!!"

I do agree, Larry; you should probably not be an Elmer. No one likes to see a grown man carry on so.

>What are the sour grapes and gloating about? Mainly, jealousy over
>certain accomplishments certain hams ...

I have seen you offering what I believe to be sour grapes, Larry. Who are YOU jealous of?

>I'm sure I'm considered to be "gloating"

No, the gloating was by those who wanted to rub in the code-test changes to the pro-code test folks. I put you in the sour grapes category in that regard, Larry; sorry.

>I'm not "politically correct" in the eyes of the slouchers, Ed.

Is it now "politically correct" to call what my upbringing taught me was rudeness and insensitivity "politically correct?"

> I'm sure you'll do your part to make up for it.

Thank you, Larry, but it is not that simple.

>I think the problem we have in Amateur Radio is that we've lost track of
>traditional values, as we have in virtually every other aspect of our
>society.

Are the mean-spirited things I have seen you say about or to some newcomers and some of those who disagree with you part of those "traditional values?"

> I don't think multi-speed code test series will solve that, but the
>fact that the code tests are a main part of the "problem" for the slouchers
>places them at the locus of concern.

Some of those who believe that the code testing should be changed have passed the code tests already, Larry; are they "slouchers" or do you have another category into which you can neatly lump them all?

>The whole thing revolves around the laziness
>of people who want privileges without making the effort to learn practical
>skills in order to earn them.

The problem is not laziness at all, Larry; it is that some people are not willing to learn the one practical skill that will satisfy you. If hams WERE required to learn a foreign language to be licensed, let's say,oh, 26 words and 10 numbers, would you be satisfied?

I think they're headquartered in Ohio somewhere.

I lived on sliders (12 cents each in those days) all the way through college. We have 3 or 4 "slider stores" here in the Mpls/St.Paul area, and about once-a-month several hams in the area get together for "gut-bomb" luncheon on the tailgate in their parking lot.

There are two kinds of people in the world.... those who like sliders and admit to it, and those who do not admit to it.

There's a strong implication that the examinee wants to drive a vehicle.
Why is no operating exam required for a bicycle?

> When you qualify as a pilot you 1.)take a written test, and 2.)take a
> practical operational exam where you demonstrate that you actually can
> fly the darn thing.

There's a strong implication that the examinee wants to fly a plane.
Why is there no operating exam for a hot air balloon?

> When you take a ham radio test you 1.)take a written test and 2.)take a
> practical operational exam where you demonstrate that you can actually
> copy code.

There is absolutely no implication that the examinee wants to use Morse
code. The exam is forced upon him/her even though he/she may have no
intention of using it.

> In neither case is one exam "emphasized" over the other. You have to
> make a passing grade on both. It's called MEETING THE REQUIREMENTS FOR
> THE LICENSE!

You have one pass/fail test dedicated to Morse code. You have another pass/
fail test dedicated to everything else in Amateur Radio combined. Therefore,
Morse code is considered as important as everything else in Amateur Radio
combined. That certainly sounds like emphasis to me, Dick.

Never ran into the issue before quite frankly. I seriously doubt that the big guns lose many contacts because they snubbed dx qsls. In their defense they will ship a card if it comes direct but not if it's in the heaps of pro-forma cards which come via the bureau. There's a Polish station which qsls every contact on every band every contest, I must have 20 of his cards. That's ridiculous, I stopped shipping him cards years ago and he still answers my cq's.

You are confused and mistaken again, Dick. I have always said that
I believe CW has merit and can stand on its own without government
subsidy. You are the one who says that CW doesn't have enough merit
to stand on its own merits. It's the Morse code *TEST* that I believe
is without merit.

> So would you care to lay out just how it is that I'm "lying" about
> CW's capabilities?

"CW gets through when no other mode can." is one lie you told.
Another is, "CW is useless at 5wpm."

> If CW
> > cannot honestly stand on its own merits, then it deserves to be replaced
> > by modes with more merit. Obfuscation about CW's merits will just hasten
> > its demise.
>
> You are not only a fool, you are also a liar.

It is impossible to lie when one prefaces a statement with an "If".
It's known as a conditional statement. Better brush up on your English
and logic, Dick.

True or False: If CW cannot honestly stand on its own merits, then it
deserves to be replaced by modes with more merit. There's no way that
statement can be false.

True or False: Obfuscation about CW's merits will just hasten its demise.
That one seems prima facie true to me, Dick. When you say CW is as good
as sex, everyone knows you're lying.

> When all testing is gone it is only a matter of a little time.

It's rather obvious that I have more faith in CW than you do, Dick.
Why do you think CW has so little merit that it cannot survive without
government support? I thought you were against welfare.

> You talk like you and everyone else posting here in support of totally
> dropping it are its friends. What an idiot.

There you go again, Dick. Virtually no ham wants to drop CW. Many, many hams want to drop the CW *test* requirement. When are you going to get that fact through your thick skull? CW needs to stand on its own merits. I believe that it can. You believe that it cannot. You are no friend of the mode.

The brush was not intended to be broad at all, Ed. I didn't mean to
imply "all other PCTA folk". Just a handful of individuals. I probably
should have said, "and a few other PCTA folk". That was my meaning.

I was not arguing against it, Ed. I was just pointing out that someone
was asking that a negative be proven, which is generally impossible in
a context like that one. It more correctly should have been stated as a
positive premise to be proven.

Why is everyone assuming that it was this "incident" that dissuaded the young fella from continuing with the hobby?

Isn't it his generation that has grown up with the reality that politically correct speech is more important than content or intent? Doesn't he have to live in a world where accidentally speaking non-politically correct words will bring down an immediate wrath.

Isn't it his generation that has grown up with the reality that wearing the "wrong" color/brand of cloths or tilting the brim of you baseball cap the "wrong" direction will get you shot to death by some gang-banger?

Hasn't every generation grown up knowing that using the right "lingo" around your piers determines whether your accepted or shunned?

I'm going to assume that the youngster is acutely aware of his environment and is more attuned to saying the "right" thing vs. the "wrong" thing than any previous generation. I would guess that he would appreciate being informed in a gentle way what lingo is "used" here.

The reality just may be that he finds CB more fun to play with than Ham radio. Only he knows the real reason. No one else really has a clue, so lets stop using it as irrefutable evidence of anything.

Yeah, and when we talk about a construction article from their magazine on the air, we gotta change modes to CW to send the name of the magazine? Maybe we can't say "73" or "CQ" on phone anymore, cuz those also originated in Morse-only days? I just love it when these purists come down from Mount Newington with their engraved stone tablets!

So if you don't operate there then you don't care, right? So, if it was not
a problem in the first, then it would not need fixing either. Time will
tell.

As far as CB stations on the bottom end of 10m goes, the operators seem to
be speaking English real good, no Spanish accent to be heard when I tuned
in. They are easy to find, just tune around for the "CW pile up".

Because you don't have to do the homework anymore. All you have to do
is take the test over and over until you get the answer right.

If it takes 5 times to learn something you really want to learn, how
many times does it take to learn something you don't feel like learning?

Sorry this is a trick question.

The biggest mistake we make is to believe that everyone would want
think and be like us (if only they knew).

Should you even be required to take a license test to be able to bitch
someone out without getting your face slapped?

I said "every hobby". Let me rephrase my sentence for ham radio:

Ham radio has it's preferred repeater lingo. If you use the wrong
lingo you immediately identify yourself as an outsider (to repeater
operation)...

If I said "W7xxx monitoring" on CW in order to get a contact, I think
I might be thought of as an outsider...or worse... :-)

A gaff is simply a social error. Using the wrong language in a
particular social setting is a gaff. Once it is done a gaff has
occurred, no matter what anyone labels it...

>How was he to know that he might face criticism if he didn't choose
>the correct words when he introduced himself to people?

In society most people are too polite to tell someone about his gaff.
They just think of him poorly behind his back. At least hams are
honest and straightforward... :-)

>Ya mean like cw exchanges are a languge?

I mean that when a cop hears "10-20" he doesn't think "I must decode
10-20....decoded....it means location". In his mind he knows directly
what "10-20" means and "10-20" has become a word in his vocabulary.
It's the same with hams and common Q signals. When I hear "QTH" there
is no mind decoding, I hear and think of it as a word. And yes the
language *quality* of CW makes me think of code groups as words in my
vocabulary, no separate mind decoding step needed...

There is no "official list". Some codes seem universal (like "10-4")
but many are not, and they vary in meaning from list to list. The
Phoenix Police Department has even changed the meaning of some of it's
10 codes over the years...

Radio magazine, which was an established 17 year old publication in 1934, appears to have had an anti-ARRL editorial policy. ARRL had just removed voting privileges from non-hams and that was causing quite a stir. I think Radio was trying to capitalize from the controversy. From time to time (when things bog down here) I'll scan and post excerpts from a few of these articles...

It has been my experience that the biggest "radio Cops" turn out to be no-code techs that have had a licenses for a year or so. I had one start on me one morning when I used the term handle.

He proceeded to tell me how "handle" was a CB term and not used on the repeater. Being the shrinking violet I am, I went on to explain I used "handle" on 11 meters when it was a ham band along with a dissertation about correcting people who may be new and somewhat hesitant such as your wife.

What a delightfully convoluted fabric you have woven to justify the boorish
behaviour of Radio Cops everywhere! Betcha I hear on 14.195 yelling "UP UP
UP" too, don't I?

The lowering of standards have been brought about by a combination of the VEC program that brings in large groups of unknown people who are "helped" into a license and the fully published question pool that short circuits the learning process, and focuses on rote memorization. That is, people can get a license so fast, you wind up with whole graduating classes that have no connection to the accumulated experience of amateur radio.

One way to get around this is to have an entry level ticket with greatly reduced priveliges, that is time limited. Further testing that reveals experience would be required to upgrade. It used to be that a novice couldn't upgrade without either turning in a log of at least 100 contacts or 100 QSL cards. Does Japan still have a system that requires SWL QSLs from Ham operators in order to upgrade from an SWL ticket?

> being heard everywhere.

The point is; These people are chasing the legitamate operators off of the air. What you have left over is people who are trying to get some enjoyment around these people and these people who get their jollies from this behavior. Yes there will be beligerant OTs left in this mess. There will also be beligerant OTs BORN of this mess. These people ARE PART OF THE PROBLEM and are easy to point to, but the way to deal with these people are to avoid giving away licenses in the first place.

I know I am guilty too. I assisted a novice once that turned out to be a jammer once he got a radio in his hands and even helped another jammer get his license. If I had only known, he would have gotten no help from anyone I knew. As it was we were able to prevent the further spread of this nonsense as they only could talk to each other and finally lost interest and lapsed without an upgrade. These days they might have a lot bigger circle of friends and a renewable 10 year license without FCC intervention.

There is an unavoidable 1st Amendment issue that says you can't enforce people to say what other people want to hear, any more than you can enforce people to listen to what they don't want to hear. The only enforcement that can be legitimately applied, is enforcement of the 1st Amendment by jailing and pulling the licences of willful interferers. You really don't want any more interference than that from the government because "behavior" is too subjective and nebulous.

Do you really want a "letter" because someone was offended? There's way too much of that nonsense going on in political arenas.

The problem with that is that the FCC isn't completely web savvy either, and again do you want them to be more of a presence in web communications? So far we have much more freedom to express ourselves here than with the "handbill" or letters to the editor or anything else under FCC jurisdiction. The MASS MEDIA only proves that the 1st amendment belongs to the highest bidder.

Some of us believe in finding peaceable solutions to this situation,
but that doesn't mean we're timid, or wimpy, or "pc" freaks, or that
peaceable responses come naturally to us without conscious effort.
And if some other people like to growl, posture, and piss in all
the corners, it doesn't necessarily prove they're tough-minded
kings of the forest whose opinion is more valid because they say
they can send it at 35WPM: On the Internet, no one can tell you're
a chihuahua.

One time, at a hamfest in AZ, I said into my 2m simplex transceiver, "Hey
Harold, y'all got yore ears on?" One ham looked at me rather pathetically
and said, "We hams don't talk like that. How long have you been a ham?"
I replied, "45 years". :-)

Being something of a nite owl at the time, I got used to White Castles in St. Louis which is as far west as they went. Last time I was down there, out of nostalgia I stopped in on Hampton Av. Somehow they are not the same without the wino sleeping in the corner.

Don't you believe it's the Morse code *REQUIREMENT* that is without merit?
I can't recall ever having seen you claim the element 1A VE test itself is without merit. The relative merit of the test would depend on it's effectiveness in determining whether or not the test taker can copy some percentage of a Morse code message at the specified speed. Wouldn't it? ;-)

Larry is the one who says the test is without merit. I can't believe you agree with him on something related to amateur radio - Morse code in particular hack, spit, barf! ;-)

The seafood at Red Lobster does not come from the sea. It is strip-mined from
an ancient fossil-seabed somewhere in eastern Montana.

It's the state beaurocracy gone berserk.

It's an experiment to see what happens when you require the sellers of electricity to sell-off their means of producing electricity, remove the limits of wholesale pricing, but keep the limits on consumer pricing. The power producers can limit supply so that the wholesale price will go as high as they want, and the guy selling it to the end user is stuck with the loss. It's as screwed up as anything could possibly be. Edison, the company that built practically everything we have out here, is getting totally screwed. Electricity has always been bargain priced out here. Our taxes will have to go up to pay for it now.

Tree Huggers:
Hug that tree today! You were so busy protesting new nasty power plants, that may cause acid rain and could hurt the trees, you may have to burn it tomorrow to keep warm.

While other factors enter the picture, I have to grin a bit when I see the NIMBY folks, that fought the building of new power plants, cut off from their internet protest sites because they have no electricity.

The problem will be solved when the big one hits, and Nevada ocean front property becomes available.

What are the odds of guessing correctly on a 35-question, 4-answer multiple choice test? If I did the math correctly, it is 1,180,000,000,000,000,000,000 to 1.

I still think it is easier to learn the material.

> If it takes 5 times to learn something you really want to learn, how

I guess I didn't think about how my words could be misinterpreted on an
Amateur Radio forum. Let me try again for you, Aaron.

The FCC does not allocate spectrum to the Amateur Radio Service only on the
basis of the fact that hams pass tests.

I do not believe that it easier to rote memorize over 1000 questions without learnign than it is to learn the concepts that are behind the tests.

> That is, people can get a license so fast, you wind up with whole
> graduating classes that have no connection to the accumulated
> experience of amateur radio.

They can't get licences as fast as I did when I studied 4 pages of study guide to get my Novice.

> It used to be that a novice couldn't upgrade without either turning in a
log of at least 100
> contacts or 100 QSL cards.

This requirement did not exist in 1963, when I was a Novice. In 1963, one could skip the Novice exam altogether and take the General. When was this rule in effect?

> The point is; These people are chasing the legitamate operators off of
> the air.

How? I have never been chased off the air, other than by the inevitable QRM that occurs to my station running +20 dBm of power or so.

> but the way to deal with these people are to avoid giving away licenses in
the first
> place.

Yes, I suppose if there are no licenses, there is no problem with operators misusing the airways.

Have not many of those who have received NALs been licensed a long time?

> I know I am guilty too. I assisted a novice once that turned out to be
> a jammer once he got a radio in his hands and even helped another
> jammer get his license. If I had only known, he would have gotten no
> help from anyone I knew.

I agree; jammers are scum. Most of those who have been given NALs for jamming are not Novices, or even recent licencees.

> There is an unavoidable 1st Amendment issue that says you can't enforce

FCC enforcement is the correct solution.

> Do you really want a "letter" because someone was offended? There's
> way too much of that nonsense going on in political arenas.

I do not recall any of the NALs being issued because someone stated an opinion that someone else didn't like. Can you provide any examples?

I think that most of the screaming about the confederate flag has been coming from south of the Mason-Dixon line. Most Yankees I know don't give it any thought at all.

Some don't think that wearing a bathing suit to church is nearly as bad as saying "first personal" instead of "name" on a repeater. :-) I know you don't like me to ask questions, but I can't think of how to do so without a question mark, so I will just come out with it -- what do you think?

Whoever originated the phrase, "honesty is the best policy" clearly didn't envision this scenario. :-)

In some parts of society, most people are too polite to tell someone about their "gaff" at full quieting in front of a group of people the gaffer just met.

Others advocate that they do.

True story.

Just after the no-code Tech license was authorized, I heard a QSO in progress on the 146.85 machine in St Louis. An OT with a brand new NCT license/call was getting reamed by a 2x2 named Curtis. It appeared that the Tech had identified himself sayng "Oh" where the "Zero" should have been. The 2x2 was calling the new ham a stupid idiot.

The Tech explained that it was an "Oh" and not a zero because the instructor in his Tech class said in ham radio the sero is ALWAYS slashed. The sero on the license wasn't slashed.

Then a few other hams tried to intercede and change the subject, but NO. Curt just wouldn't let it go. It really got ugly and I was embarassed for ham radio and felt sorry that the new ham had to get that kind of greeting.

Now Dick will come on here and say that the new Tech should already know everything there is to know about ham radio and "should have known" that it couldn't have been an "Oh." After all, he passed a test.

Why guarantee a profit? That is ultimately what regulation does and has to do. I believe you are on Northern States Power which as utilities go is a good one in a lot of respects. But if you called there I will bet that now and certainly the next cold snap you will be buying power from the Nebraska Public Power System via MidContinent Area Power Planners lines, a loop from NSP to Chicago to St Louis to KC to Omaha and back. You will pump it back next summer.
The history of consumer-owned power in Nebraska is a great one with rates about 20 percent lower than the national average. Right at the moment I am probably being supplied by the nuke at Fort Calhoun on time, on price, and reliable as sin.

Public power is one of the legacies of Senator George Norris. Norris Dam on the TVA is named for him, GW Bush is being inaugurated 20 Jan rather than March 4 because of him, and Nebraska has a one-house legislature because of him although the local 'conservatives' cum idiots limited the sessions making filibusters possible (Norris was in on a famous filibuster so one of the things he pushed was unlimited sessions). My water and gas come from a more local Metropolitan Utilities District that also does its job extremely well.

The trick -- and it is hard to do -- is to limit the scope of the utility's responsibilities and not to politicize everything. The TVA nearly foundered until David Lilianthal(?) firmly put them in the power business.

I am as much a fan of free enterprise as anyone but I just do not see where electric power should be free or particularly enterprising.

I agree that it may be better to allow a new ham to listen rather than jumping him on the air. He'll soon realize that we don't generally use certain terms. People generally try to fit into anything to which they are new and usually will come around to "doing as the Romans do" on their own.

Like you, I've had a couple of run-ins with "radio cops". I once used the local auto-patch, pounded it down, and made the usual announcement- "K4KWH clearing auto-patch after third party traffic with XXXX......." R-cop proceeded to lecture me that I was to do that BEFORE bringing down the patch. I didn't see the difference--still don't--just so I made the required statement. I was nice to the old codger, but I was seething. Some time went by--maybe several years--when one night I eased down to the local Dairy Queen for a huge cone of ice cream. The local club was having their usual Tuesday nite VHF net on the same repeater. All of a sudden, a pickup changed lanes and ran a Chrysler off the road onto the sidewalk. Poor guy (car) busted a tire, ruined a hubcap, bent a wheel, and missed a light pole by inches. Pickup kept going. I broke the net with my call, told the net control station I needed to call the police because of a hit and run, and he immediately yielded the repeater. I brought up the patch, started to dial 911 and somebody pounded it down right out from under me stating, "THAT IS NOT EMERGENCY TRAFFIC"! Guess who it was. The same old geezer that jumped me about the patch previously. It started something of an on-air debate/argument with this old fart trying to lecture ALL of us on what is an emergency or not. I didn't take kindly to this because the hit and run driver was long gone during this 3-4 minute debate. I finally spoke up: "JUST NEVER YOU MIND OLD MAN. THE HIT AND RUN TRUCK IS GONE AND I HOPE YOU'RE DURNED WELL SATISFIED!"

I wasn't the only one that got mad at him. The club was ready to expell him, but finally decided on a suspension. Trouble was, the old buzzard wouldn't let it die. He started talking about me on and off air to others, making most inappropriate suggestions about my qualifications as a ham. Completely out of line and unjustified. I had never done anything to him, nor had I actually met him in person. Of course, it got back to me. Fed up with this guy's attitude and antics, I finagled a personal introduction. Upon realizing who I was, he turned a little red! I then proceeded to inform him that if he did not cease and desist from his slander, that there would be legal action. If that didn't work? I think I remember putting it to him this way: Mr. ----, I have never met you before. I have never done anything to you. You have an "alligator" mouth and a "canary" a** and your mouth is fixin' to write a check yo' a** can't CASH! Do you understand me? You are not to speak

to me, call or correct me on the air, nor have any contact with me whatsoever!" That old man turned pale as a ghost, dropped his head and said, "yes, sir", like a scolded little boy. I haven't heard a peep from him in 5 years.

Perhaps we need to have them submit an application to test. Color photograph must be included. Then the VEC can review the apps and give a thumbs up to some and a thumbs down to the "ones that don't look right."

who
> are "helped" into a license and the fully published question pool

The old method almost required being inducted into the lodge by an existing lodge member in good standing.

that

I'll agree with you here. For someone with no background in electronics, the only viable method of passing the exams is some memorization and/or word associations.

> That is, people can get a license so fast, you wind up with whole

The beligerants probably "earned" their licenses the hard way (whatever
that is). Each new crop recalls their learning to have been the
hardest.

Ding ding ding ding ding! I agree with that.

I'll support the learners license good for two years or age 18,
which ever is longest. Maybe 25W on 10M and 440, otherwise all modes,
no repeater trustee stuff.

It was an ARRL VEC in Woodstock, IL ... put on by the
McHenry County Wireless Assocation. I could dig up the
names from the CSCE, but i don't think we want to put
anyone on trial here. :)

> Irrespective of who it is, it's an example of poor training of the VE

I really don't have anything to complain about... i didn't pay the
additional fee -- i just didn't take the extra class exam after I
passed the general class one.

California can thank the tree huggers for their current energy crisis.

Just proves it doesn't take all kinds to make a world, we just happen to have all kinds. Must really suck to be someone like this guy.

Well, I don't like 'em either, but blaming them would shift the blame from where it justly belongs, and that is with the legislators. They deregulated the phone company federally. So the state thought they'd take a crack at the power industry. You ought to see all the fees, and surcharges, and taxes, and rebates on our electric bills now. Looks like it was designed by a committee, and nobody can figure out the damn things. The idea was to spur competition, but an unfortunate sequence of events, along with the help of some opportunistic and unscrupulous companys lead us to where we are now. It would have been difficult to foresee this particular outcome.

I think that you have that backwards. You don't like *me* to ask questions. In a recent post you refused to answer my simple question: "Do you think that a test that allows people to pass without knowing the material is a good test?" because you said you didn't like my *debating style*... :-)

Here are 2 more questions you recently ignored. if you're going to ask questions, don't you think you should start answering some... :-)

(1) Do you think it was morally correct for Bash to circumvent the FCC tests by publishing the exact questions and answers, thus allowing hams to pass the test by cheating?

(2) Do you believe it would be OK for me to lawfully but clandestinely obtain a copy of an ARRL employment exam, say from an employee who owes me a favor, and print and sell it to those seeking employment at ARRL?

Hmmm. I know a lot of those guys. I ran exams just down the river from them in Aurora. In fact, the guy that started the testing group up there years ago and I were both with DeVry VEC originally. I can't remember callsigns, since I've moved, but there must have been some turnover that leaves some uninformed VEs, because the guy I know wouldn't do that or train his people to do that. Sorry.

> I really don't have anything to complain about...

Yes you do. You were prepared for an exam and an incorrect interpretation by a team that should know better kept you from taking the exam when you were ready. Although you might not get any satisfaction, they need to be made aware of the problem so it doesn't happen again to someone else.

So there are no third categories?
You Political Correct mavens insist that your choices are all there is.
What would be the matter with some newcomers with an attitude of "I'm gonna get this and do it well, make my mistakes and get it right and to heck with the minor irritations, whatever they may be. Maybe I can learn something about it all from them, if I don't let the chip blow off my shoulder".
It must be in the water. NO one today seems to have anything but a fragile, easily destroyed ego. If I had been like that I'd have never made it into the teenage years, much less far beyond.

It still raises my hackles a notch to hear on the ham bands clone
conversation from CB where not much but the frequencies and (maybe)
callsigns are changed. It always seemed to me that people who adopt a
new environment might be interested in adopting its conventions also,
given a little time.

But so far I haven't called anyone down for doing it. Don't plan to
either. FCC has given the ham bands to the CBers, fair and square.

Gotta be paid for one way or another. Chalk up one good example of the
limits to scatterbrained deregulation. I'm a hardcore open-market
free-enterpriser to the core but this disaster has set the clock back to
justification for socialism, this is bloody ridiculous.
>
Here in Philly we pay the second highest rates in the country second only to
what ConEd gouges out of their NYC customers and have been doing so for most
of the prior century. The net result is that we're conditioned to getting
pounded by our power bills. Folks moving into this region from other places
routinely come unglued when they get their first PECO (or whoever it is
these days) bill. But there is some spare capacity here with more coming.
Two-three years ago the new-wave generating companies were mothballing
capacity. Now every steam turbine and generator shop in this country is
suddenly completely booked for years ahead for the first time since I was a
kid and that was a LONG time ago.

Don't you ever get tired of being wrong, Gnat? As it happens I did have
a contact with a new ham where the very same thing came up, the zero

without the slash on it in his callsign. I mentioned to him that it actually was a zero but the FCC's computers stopped putting the slash in the zero years ago. Evidently the FCC doesn't know the difference, either.

I once knew an OT who had been off the air so long that he was new to
repeaters, and when he finally got a two meter rig he called CQ on the
repeater just as he would have on HF.
It isn't always the newcomers who miscue.

See? All the protestations from myself and others have had an impact.
You gotta wonder if there would have been any improvement in some of the
questions had we not sounded off so much about them. Whoever changes the
questions must have been paying *some* attention. I'llhave to sign into
the HQ website and check out the current question pool. If a majority
are written like those it represents a major change in things since I
was an active VE. Inded it would be easier to just learn the material on
those few. They would be hard to answer without knowing the material.
'Twas not alwas so.

Dick, a better response would have been, "So then you're joining the crowd," but no, you insanely accuse me of being the ONLY ONE that does what Larry does. Well, if Larry does it, and I do it, then I couldn't possibly be the ONLY ONE.

Additionally, you excuse yourself, Hans, Kelly, Jelly (Fred), Bruce, Steve (shrill), GrayJL, and all the ANONs, from the cluster of people free to be jerks. The only way you're statement could be true is if you and your cronies were made to be jerks at gunpoint, thus not of your free will. For that many gunmen to be present at so many geographical locations to pull off such a feat would make it a conspiracy, which makes you crazy.

I really try to provide a rational argument. I'll usually give you at least 2 or 3 tries after your initial shitty response to say something rational. After that, all bets are off.

Dunno when David did that but I was temporarily working in a small burg north
of Jackson TN, winter 1980 or so, the locals had been paying three cents per
kwh while I was paying eleven cents per kwh back home in Philly. I got there
just after the TVA underwent some kind of major reorganization or another and
the rates had just taken a huge jump upward. Everybody had unisulated homes
with straight electric basboard heat, etc. Talk about massive trauma . . I
couldn't muster a whole lot of sympathy for 'em.

Yes,they are supposed to be.

These guys seemed pretty
> confident that they could charge $10 per exam

By the authorizing law they are not supposed to charge beyond recouping
their expenses, unless it has changed since I was active. I understand
that the FCC has stropped setting the mandatory fee, so the VEC under
which they operate should be doing it.

FCC never did stipulate nor specify what constituted an expense, they
just said that the expense must be related to the testing and that a
record of all monies received and disbursed be maintained.
The fee receipts were always split by the VEC (ARRL here) and the VE
team. The VEC sets the details of he split.

Sorry to see my old machine -- I built ABE 4 -- sink to this level. That
sort of BS is why we put it on in the first place. 'Youse vill march in
schtrait lines und youse vill like it' was certainly the motto of some of
the local machines; our's was 'if it don't get you in trouble with Sam, we
don't care'. Curtis would have been eating his meals off the stove after
some of us got done with him.
When a few docs and the Federal Venereal Disease Control Officer got
clinical on the air, you could hear the strak jaws tighten for miles.

Hans, there appears to be the hint of a counter-challenge in your reply to Fred. Anyway, I like the peacable solution part. Do you have any details?

>Len, I guess I can understand your resentment towards those that obtained a
>formal education.

"Resentment?!?" I had 11 years of college-level formal education at night while working full-time during the day for 15 years. My only "resentment" is towards the arrogant recycled log bundles who accumulate paper without the accumulation of knowledge.

>The fact is many have neither the ability or the self
>discipline to learn on their own.

I disagree. Did someone come along and inject you with your "superiority" knowledge or did you develop that all on your own?

>They are not blessed with your tenacity and innate intelligence.

Tenacity has no relation to intelligence.

>The problem with being self taught is you have someone as ignorant as you
>for a teacher.

Oh, my. Will you start using swear words next? :-)

>One wonders if a self taught instant extra has even considered the safety
>issues associated with high voltages and mechanical supports.

I wonder why some jelly-bellies want to get chewed on... :-)

The modern 1 KW final PA runs on about 50 VDC maximum ...roughly twice the voltage considered "safe" in the National Electric Code for residence wiring. Not exactly lethal unless one sticks 50 V wire ends into their chest.

Jelly, old bean, I broke into HF transmissions on 1 to 15 KW tube transmitters. In 1953. Rather high voltages there. Those PW-15s by Press Wireless had very sturdy mechanical supports. I don't recall any of the many non-Extras who worked at Army station ADA were fatally or even near-fatally harmed.

>I suffered through a formal education that pointed me in directions I would
>not have even considered.

"Suffered?!?" You didn't feel you were "superior" at the time? :-)

My college-level formal education was almost entirely elective since my "direction" was already made and in-progress. The formality of sitting in class listening to basic training in English and Math (when I had already used both on the job) was a requirement towards a piece of paper that said I was a Bachelor or something. I was already a bachelor, Jelly. :-)

I did "suffer" through my last English class since I intended to court the nice female instructor. Wouldn't have looked good to mess around with an instructor before finals and grading, would it? [we parted amicably a half year later in case you wondered]

>Things that I would have discounted on my own as
>being useless, I admit some where, but many came to be of valuable use in
>latter years.

Speaking of "suffering," I took a non-credit class in digital logic where the Japanese-American instructor had some kind of Prussian complex (strange ethnic cross-over). In this martinet's class an Exclusive-OR was not permitted. He wanted to "expel" me (from a non-credit class) when I brought in a standard TI Ex-OR quad chip. "Doesn't exist in my class!" he shouted. I've had required psychology classes where the instructors needed psych counseling worse than the students. I've had required history instructors who wanted to rewrite American history (in favor of the "south"). Bullshit most of them except for math...some of which I already knew and some of which I would never, ever use again.

Fred JLE, don't try to "lecture" me on college-level "directions." Try to "lecture" me on Extra class class distinction and your "superiority" of CW above and beyond every thing else in amateur radio.

Was it really "worth it" to sit night after night listening to some instructor-expert tell me what I had to know on my job when I was already doing my job successfully? Not really. Probably a third of my classes were attended by those who already knew what to do sucessfully but had to endure it all for some piece of paper "proving" they could do what they were already doing very well.

What does a student do during "homework?" Think about it. They SELF-TEACH by completing their assignment, showing their work. They only thing different between such self-teaching and self-techning from a text or informative article is that the instructor in a formal class will "grade" the student towards some achievement of a piece of paper.

Which do you consider the Most Important, Mr. W4JLE, actually having learned-and-accomplishing something on your own or having an accreditation certificate or diploma hanging on a wall? [I think everyone can see the preference but it

would be nice to see the words of rationaliz...oops,
justification as to which is "superior." :-)]

>While your opinions of my stances were read and enjoyed, as always I
>disagree with you.

Naturally. You are so much more "superior." [barf]

This is a bit like nailing jelly to a tree...

A problem with any vigilante group of self-styled "cops" occurs
when they run into another vigilante group having different
ideas of what is "best." Nobody wins except the Real cops.

Remember that CB users outnumber radio amateurs by a
considerable ratio.

No, just greed and inefficiency by some private electric power
providers. In the Real "La-La Land" (Los Angeles), the
municipal Department of Water and Power has NO electricity
shortage. In fact, the DWP is today (Thursday) selling electric
power to mid-California!

No rolling blackouts in Los Angeles, none expected. The
only one "going berserk" is the press trying to make a
Big Story out of it. Idiotic journalism.

>could barely pick up the signal even when the radio was outside of the
>metal box. I don't want to make this mistake again.

Do not use a metal box. Use a plastic box. Many kinds
available.

A metal box surrounding the FM receiver will shield it from
picking up anything but very strong signals...to strong to be
legal in a "wireless mike" type of application. Plastic is not
a shield to stop radio waves.

>Or if
>this isn't the best usenet group to post this in, can anyone point me
>to a more appropriate one?

The above answer to your problem is the quickest and cheapest.

If you want to have a very cheap cover for the FM receiver, go to
a supermarket and buy a plastic food container. Many different
sizes. Paint it whatever color you want with spray enamel.
Enamel works better than a lacquer paint on that type
of plastic.

I did that with a remote temperature sensing gauge that transmits
outside air temperature to an indoor indicator. The container
keeps rain out of the remote gauge. [Frequency is about 433
MHz, five times as high in frequency as the FM broadcast band]

A look at the stats of new licensees over the last decade (life of the Internet, now 10 years old...most of the life of cellular telephony, now about 14 years old) will show that the overwhelming majority are the no-code-test Technician class. QED.

I wish my wife was only "somewhat hesitant" to talk on the radio. It
took me some time to convince her to get the license in the first place.
She doesn't even like talking on the telephone. Of course, in person,
once she gets to know you, she'll talk your head off. And I can't get
her to shut up (especially while my favorite tv shows are on).

It's a classic case of officials burying their heads in the sand. Any schoolchild soon learns that you can't buy high and sell low and avoid financial collapse.Sure looks like they just ignored the liklihood that this *would* happen.
This is not something that developed overnight, of course. From all accounts it came from price controls on the retailers of electrical power while no controls were (or could be) placed on wholesalers (after the in-state retailers were forced to divest themselves of their own generating facilities, which was a curious requirement at best, pure socialism at worst).
This is not a problem that just struck like lightning from the blue, it took a while to develolp. Meanwhile did the state officials believe the problem was just going to go away because the solution wasn't pleasant?
And then not a single new generating facility has been built in California in the past 20 years. Where did they think the supply for all the growth demand was coming from? Meanwhile, the state is loaded with environmental activitists who feel real good about locking away all the natural resources for "posterity" instead of meeting the environmental protection challenges headon with sensible protective requirements that are enforced.

Now you know why. I saw on TV today that PG&E and So. Cal. Edison's stocks have been downgraded on Wall Street to junk bond status. Whew!

> Our taxes will have to go up to pay for it now.

You know what that means. It'll cost twice what it should.

You're probably right, Ed. I'm still working to get my wife excited about radio again. And I've become the biggest advocate for new hams in my area. I like to be known as the ham anybody, including the newbee, can contact.

In fact, because of my friendly attitudes towards newbees, just about everyone in the area who is bringing a new person onto the radio for the first time almost always insures that I'm the first person they make contact with.

I've met a lot of interesting people that way. In fact, over a period of time, the numbers really add up and I'm never lacking of someone to talk to on the radio. Most of the time, I end up with too many people to talk to when I sign on (they know my normal on-air times, and are usually waiting).

There has been much talk about the Clinton legacy. As William J. Clinton leaves office, lets take a look at a few things around the country to discover the real Clinton legacy.

Politics & Race Relations...

- A wider divide between Republicans and Democrats than anytime in recent memory.

- A wider divide between blacks and whites than anytime in recent memory.

- Massive expansion of executive power over almost all aspects of American life.

Energy...

- An energy crisis in California, complete with high prices and rolling blackouts.

- High home heating fuel, and vehicle gas, prices nationwide.

Economics...

- An ongoing loss of income for the often white middle class over the last eight years.

- An unwavering increase in the gap between rich and poor.

- An unstable stock market.

Crime Control...

- Youth violence, and other crimes by youth, higher than any other presidential period in history.

- The largest prison population in the world.

- A memory of a president impeached for lying under oath.

Civil Rights...

- Ongoing discrimination against whites in black-owned schools, organizations, and businesses.

- Continuing hiring discrimination against whites through affirmative action programs.

- Widest suppression of religious freedom in the history of this country.

- Significant loss of gun ownership rights.

- Failed program of allowing gays in the military.

Education...

- Strong emphasis on liberal political bias in classroom instruction at public schools.

- Government finance of private colleges and universities with extreme liberal political bias in classroom instruction, while at the same time refusing finance to conservative private schools.

- Emphasis on "feel good" teaching methods rather then on teaching methods which challenge students.

- Least well educated children during any period of nation's history.

Family...

- A historic record for divorces, single parent families, and children born out of wedlock.

- A wider divide between parents and children than anytime in recent memory.

- Diminished parental control over their own children due to endless government intervention.

- A historic record for children giving birth to children.

- A memory of an extramarital affair while president.

Sadly, I wish I could say that these things will improve after Clinton leaves office. But, as long as liberals continue to control so much of American life, these things are simply not likely to improve.

Like Clinton did, Bush also has an opportunity to influence each of these things, but he has not shown any indication so far that he intends to challenge the liberal stranglehold on this country.

Brian, I'm in West-By-God-Virginia on a full time basis now. The
suitcases have been stored in the barn.

My "opponent" doesn't have a license and has shown little evidence of
any class. He sits at the keyboard all day doing what he accuses others
of doing. He is a twelve year old trapped in a body which has been

shedding skin cells for about seven decades.

Don't get me wrong--I like a lot of older folks. I hope to be one someday.

I am in great agreement with you on that, Hans.

Incidentally, Southern California Edison Company (under its larger
umbrella corporation) did not "build everything 'we' have" here. It is
the largest private electric power supplier in this state, but not the
only one. 'Edison' has been buying power from other suppliers for
years...but got suckered into complacency by regulated rates for
such buying and selling among power suppliers. LA Department
of Water and Power did not. LA DWP presently charges about
10 1/2 cents per KWHR to residential subscribers. Washington
state power companies serving Puget Sound area charge about
6 1/2 cents per KWHR (source: residential billing from the two
named areas).

Cecil, the only "unpredictability" is two things: Management of
private power companies; over-inflated rates now possible by
sellers of electric power.

The municipal Los Angeles electric power provider, the
Department of Water and Power, has no electric power
shortage. [will you agree that Los Angeles is a large city?]
The LA DWP is presently selling electric power to middle
California. There are no rolling blackouts in the LA DWP
service area, none expected for a long time.

I know that kinda spoils a good back-and-forth, but that's
the situation in Southern California now. :-)

What is this glorious, religious connection to the past and
only the past of amateur radio?!?

We already have the self-proclaimed expert on morse code
over landline in Jeff the Herman.

If you want some cogent historical information on the history
of ALL radio in the first 30 years of its life, read "Continuous
Wave: Technology and American Radio, 1900 to 1930," by
Hugh G. J. Aitken, Princeton University Press, 1985, 588
pp (clothbound, ISBN 0-691-02390-5). Aitken is George D.
Olds Professor of Economics and American Studies at
Amherst College. Aitken also wrote "Syntony and Spark:
The Origins of Radio," ideal for those 'historians' who don't
know much about vacuum tube theory.

Yes, some doofus will jump in here and loudly proclaim
about "200 Meters and Down," by DeSoto. To those I
would direct to Aitken's book and the large footnote on
page 512 of the clothbound edition (Towards the end of
Chapter 10). Aitken is looking at the history of all radio,
not just the biased view of some amateurs. Amateur
radio must coexist with all other radio services and it
would serve all amateurs to consider such coexistance
on a realistic basis.

It is not fully realistic to get historical data from a few
biased sources and spend time in the lodge hall doing
high-fives without looking out the window and everyone
else. Open the window curtains, clean the glass, and
look out. You may not like the view but that's the rest
of the radio world, like it or not.

W6MJN loaned me his copy during a Wednesday lunch.
Fascinating history.

Okay, go back to your old 1934 ham magazine issues.
Be careful that those old acid-paper pages don't crackle
and break. :-)

Yep. Seniority makes little difference in making a gaff. And neither
"CQ" or "W7xxx monitoring" say in plain english what it is we really
want, namely a contact. Hobby jargon and knowing it's proper use is
important, and if you try to operate without knowing it, then let's
hope that you're not too sensitive of a person...

947. FCC proposal for new Amateur "Colt" License Class

Newsgroup: rec.radio.amateur.policy
Date: 2001-01-19 06:52:23 UTC
From: Stewart R Teaze <HORSESHOE7@prodigy.net>
Message-ID: <948o9h$4mg4$1@newssvr05-en0.news.prodigy.com>
Source record: 1197
Cross-posted to: rec.radio.amateur.policy,rec.radio.amateur.antenna,alt.radio.family,rec.radio.cb,rec.radio.amateur.digital.misc

The rapidly-expanding Family Radio Service has exposed millions of young people to the world
of radio communications. But now, where is a young kid to go who has is interested in experimenting
with radios and get more range than the typical 1/2 mile of FRS? MURS might help a bit(if Motorola doesn't
get their way), but you know that a growing mind is eventually going to want more than just this. GMRS
doesn't have the resources, and is not a service that was created to foster experimentation. Like it or not,
the typical young person ends up cutting his radio experimention teeth in the Citizen's Band service, because
there isn't a reasonable entry-level ham license for kids(it is even worse now after restructuring, what with the
elimination of the Novice Class).

Everyday now the USA is falling further and further behind Europe and Japan in the wireless communications
race. As hams, it is time we make an effort to insure that our young people are provided with the proper
environment, incentives, and role models to properly learn radio communications techniques and etiquette.
It is time for hams to stop complaining, step up to the plate, and take an active role in seeing that our bright,
young technical minds are being taught properly.

As a result of this, I have reworked the Communicator entry-level license proposal I submitted to the FCC last year,
and I will now be proposing a new entry-level Amateur Radio class known as the "Colt" class. I submit a draft
of the proposal for your review below. Please keep in mind that the future of American involvement in wireless
communications development depends on us to properly encourage and teach tomorrow's experimenters, operators,
technicians, and engineers...

****
Proposal to FCC to institute an introductory-level "Colt" license class in the Amateur Radio Service - REV A

In the late 1980's and early 1990's when the current Amateur Radio Service Technician Class license was conceived and implemented, it was
an appropriate alternate introductory license class. However, due to the recent elimination of the Novice Class license, and as a result of improving

technology; the Technician Class license no longer serves well as the only introductory license, as it is doing poorly in drawing young members into the Service. As a result of license restructuring, it is now actually harder for young people to obtain an Amateur license than it was before restructuring.

In this critical era of global competition, especially in the wireless communications arena, it is essential that we provide a means for properly educating our young people in RF communications operation and theory.

Today, technologies like the Family Radio Service, high-speed telephone & cable modems, the Internet, and inexpensive cellular telephones, have overshadowed the privileges of the Amateur Radio Service, and made the requirements for young beginners to obtain a Technician Class license out of date. Additionally, the Technician Class license has now evolved into a beginning and ending point for most modern day Amateurs, who are mostly interested in VHF/UHF communications, rather than HF communications. Incentive licensing has virtually been eliminated.

The need for a Service dedicated to the goal of teaching young radio users proper radio operation techniques and etiquette can clearly be seen in the disarray present on the 11 meter Citizen's Band Service frequencies. The fact is, the Citizen's Band has become the defacto introductory service for young people just beginning to learn to experiment with radio; yet the Citizen's Band is a very poor environment for young people to be learning in.

Therefore, it is recommended that a new "Colt Class" license be added to the Amateur Radio Service expressly to encourage young individuals to enter the Amateur Radio Service to improve their understanding of RF communications theory, provide a healthy learning environment, and encourage radio experimentation.

On the 70cm UHF band, Colt licensees would be restricted to voice communications on 5 simplex-only 20khz-spaced channels on 446.00, 446.02, 446.04, 446.06, and 446.08 Mhz; and digital communications up to 19,200bps on 1 simplex-only 60khz bandwidth channel on 446.14Mhz.

On the 1.25m VHF band, Colt licensees would be restricted to voice communications on 5 simplex-only 20khz-spaced channels on 223.42, 223.44, 223.46, 223.48, and 223.50 Mhz; and digital communications up to 19,200bps on 1 simplex-only 60khz bandwidth channel on 223.56Mhz.

To encourage experimentation/understanding of antenna and VHF/UHF RF propagation theory, Colt licensees would also be allowed to setup and/or operate through a VHF/UHF crossband, simplex user input/output, repeater station on two 20khz-bandwidth channels on 223.52Mhz and 446.10Mhz. This would allow them to setup an inexpensive repeater system by interconnecting the voice/mic connections via a resistive circuit on two simplex radios; and

would not require expensive, and difficult to understand, cavity and duplexer filtering at the repeater station site. User radio costs would be low, as they would only need a single simplex radio. As a result of the characteristics of this type of repeater, the repeater builders and users would learn to coordinate frequencies, and user groupings based on environmental conditions, so as to acheive optimal results.

Colt license users would also be subject to the following restrictions:

(1) Individuals applying for a Colt Class license must be under 19 years of age at the time of license application or renewal. The license is valid for 5 years.

(2) Fixed control station antennas will be no more than 6.1 meters (20 feet) above the ground or above the building or tree on which it is mounted.

(3) Transmissions limited to 5 watts ERP, or less.

The new license class would have the following goals:

1) Encourage more young people to enter the Amateur Radio Service, by providing an entry-level ARS license class that includes privileges allowing reliable short-range voice and data communications.

2) Not significantly impact existing users of the affected Amateur Radio Service frequency bands.

3) Encourage basic knowledge of radio, electronics, operating principles and etiquette among a wider segment of the general
population.

4) Take advantage of the success of the Family Radio Service, and provide a path for those young users interested in further radio experimentation.

The Colt license exam would consist of 25 fairly simple questions. Emphasis would be put on understanding the existing operational, safety, etiquette and emergency questions from theTechnician Class question pool that relate specifically to Colt Class license privileges. All questions containing calculations would contain small integer(whole-number) input values and have relatively small integer results. Colt licensees would be required to have a general understanding of Ohm's Law and Power relations. They should be required to have a general understanding of how antenna length relates to wavelength; and have a knowledge of transmitter power, antenna gain, transmission line loss, and the ability to perform a simple ERP calculation would be required. General knowledge of simple resistive circuits, and their power dissipation, would be required. Knowledge of capacitors and inductors would not be required.

At one time here, roughly two weeks ago, some electric
power brokers were charging FORTY times per KWHR
versus the same rates of 1999. I don't think anyone saw
that kind of greed.

>> In the Real "La-La Land" (Los Angeles), the

>> shortage. In fact, the DWP is today (Thursday) selling electric
>> power to mid-California!
>
>Fortuntely for LA it has it's own system. Didn't know that until now.

The LA DWP is not perfect. It has been involved in some
management-politics scandals in regards to water, the W
of DWP. Since they are a municipal organization, the
county supervisors got a new manager. The result is
enough electric power for this service area plus the
capacity to help out other areas in California.

>No doubt there is a lot of that, there always is, but blackouts cost buckets
>of money for everybody involved and big outfits like Intel deciding to build
>somewhere else has real-world ramifications.

Agreed. Every zone-refining boat going slowly through the
furnaces has to be re-melted and started over again if the
RF zone heater goes off-line. There's a whole heaping glob
of semiconductor makers up in Silicon Gulch...and a few
of them down here in nearby Riverside County.

The state of California is not perfect. The state Congress
learns rather slowly (a semi big rig suicider might have
shaken them up a bit, heh heh). Between the state and
the city of Burbank, Lockheed called it quits here and went

to a kindler, gentler Georgia. Not on power, but on taxes
and other regulations. Burbank = Lockheed used to be an
equation. No more. The last Lockheed building has been
levelled. End of an aviation era for the locality.

My wife and I were in Burbank this morning. Burbank has
their own powerplant and independent about it. The stores
in Burbank have cut back severely on lighting to avoid having
to buy electricity from elsewhere...such as the LA DWP. :-)

>The silver lining should be that it's a wakeup call for other regions even if
>it is more hype than reality. The power execs around here are in the news
>answering
>pointed questions in a very defensive mode. A couple state reps are calling
>for formal independent reviews of the situation here. Works for me.

Absolutely. Roger that. 10-4. Affirmative. :-)

It's not the "tree huggers" doing it. It's not the municipal power
companies doing it. It's not the "fault" of free enterprise. It's the
fault of BAD MANAGEMENT of private electricity providers still
operating in a monopoly service area. It's partly a fault of bad
thinking that a utility service is "just like" the free enterprise
selling of goods. It isn't. None of us can go to any store and
pick out a bargain on electric power. There are no plugs and
jacks on the utility poles that allow us to change connections
to "another" electric power company based on personal
preferences or KWHR rates. Utilities do NOT have "goods"
that can be handled in any conventional free-enterprise
system.

Imagine a situation where this pseudo-free-enterprise system
was carried to sewer services. [don't want to think of it!]

>rights.
>
>That's different, right?
>
>73, Jim AC6XG

Jim:

In such a situation, an armed response by law-abiding citizens would
definitely be in order to prevent the armed environmentalists, convicted
felons, abortion rights activists, and Ku Klux Klansmen from *actually*
shooting our elected Congressmen and Senators. The responsibilities
of lawfully-armed citizens are a two-way street. We have a responsibility
to be ready to defend freedom with our lives, our fortunes, and our
sacred honor. People such as you describe are probably not as
committed to their cause as those of us who are just ordinary, decent
citizens who believe in and support our Second Amendment rights.

What causes are you willing to fight and die for, Jim? Are you willing
to die for baby killers, tree-huggers, and violent racists? Our high-
sounding ideals don't stand for much unless we are people who
believe in highly moral principles. The environmental issue aside
(I consider myself to be an "environmentalist" also), the people you
mention above are just amoral, self-serving criminals. People such
as that are usually cowards, and are not willing to risk their lives to
defend their beliefs.

Ed:

I didn't miss the point. The requirement motivates the learning; the learning motivates the need to acquire the equipment. Those who learn the Morse code well enough to effectively employ the CW mode on-the-air will also have the equipment to do so; therefore, they will be equipped to use that mode in the event of any sort of emergency where it would be practical to do so.

True, he did not -say- that. True, Riley gets to deal with the few
jerks in amateur radio who violate the regulations while on the air.

However, taken in the context of the Clint DeSoto thread where I
highlighted the idea of an amateur radio brotherhood, he implied that
hams talking to hams OVER THE INTERNET have no need to share in any ham
brotherhood.

Such an idea spouted from your mouth in years gone by. You appear to
have a loyal following.

It sure is. I find very little about "journalism" in SoCal's
media to be anything BUT sensationalist. Not that it isn't anywhere
else.

Kinda like the 30MPH "pursuit" with 100 crusiers "chasing" two
men..?!?!

The VE's were incorrect to ask for another fee to take the extra. That should have been covered under the one fee.

Also, the VE group can keep a part of the fee, but only enough to cover their expenses. Their time cannot be charged. The rules did just change on keeping records of expenses incurred.

Oh nooooooooo....NOT again!

Stewart, I think this "new" license class was the RESULT of one
too many "Colt's".....Colt 45 Laager's, that is......

The FCC MAY assign another RM, but I bet a Happy Meal that they
just say "Been There, Done That".....

They just got done paring down the number of classes...They did
NOT do that just to make room for NEW licenses.

There are already NUMEROUS stories of YOUNG kids (7-8-9) passing
the PRESENT Technician license, so I really doubt they will predisposed
to creating something "new".

If you REALLY want to make an impact on kids in Amateur Radio, try
writing a text FOR kids...THAT will help them along the way. Trying to
wrangle a "new" Amateur Radio license out of the FCC for posterity's
sake isn't it.

You're welcome...but hang on........

WHAT poll did you conduct that has determined that "the majority
of FRS users" are "not radio hobbyists..."...???

Furthermore, as much as I disdain Stewart's attempts to again
create something the FCC (and the commenting public in general) has
determined to be unnecessary, it is still directly aimed at FRS users
who might otherwise wish to expand beyond FRS use. "alt.radio.family"
IS a valid forum for his ideas, as irrelevant as they may be.

Lastly, unless you can show me where you are the "listowner" or
the charter holder for "alt.radio.family", I am hard pressed to accept
any of your admonitions to NOT post to that NG. Last I checked, it IS
an OPEN forum.

According to the ARRL VE Manual , Eith Ed. , 2000, p. 50,
under "Retesting,"
"An applicant who fails an element at an ARRL/VEC-coordinated session
may retake that element at the same session, if (1) the administering
VE team has a different version of that element, which the applicant
hasn't taken (section 97.509), (2) the VE team has the time and
resources and is willing to readminister the additional version; and
(3) the applicant pays an ADDITIONAL (emphasis mine) TEST FEE (because
the candidate is then considered a walk-in candidate who just arrived,
even if he or she arrived at the beginning of the session). Again, a
retest fee charge is only required if an element is retaken, after
being failed at your session."

The W5YI VE manual has the same thing .

The reimbursement fee (test fee) is the only fee that may be charged at
a test session. Now, if the test session occurs at a hamfest,
instruction class, or other gathering, an admission fee may be charged
and it has to be kept seperate from the test fee. If you're just going
to the test sesion at a hamfest, you shouldn't be charged a fee.

Well Fred things have changed in your 62 years. Some for the
better, some for the worst. As many things as you can come
up with that are bad, I can come up with that is good. Things
change!

I have been reading this groups for a good while now. Whe
I started I was very much a pro-coder. I listen to what
the no coders had to say as well as the pro-coders. Hint:
If you really want to learn listen closely to the side
your disagree with. I did that! Thank you all the
no-coders that posted. There is at least one (ex) pro-coder
that listened.

Here is the things I learned:

1. the code requirement doesn't improve the character of the
hams joining the ranks.

2. It is just a tool/mode. Sure it tugs at the heart strings,
but it is just a tool/mode. A tool that requires a lot of study
to use. Modern digital modes get thur just as well, without
the years of study that is required for CW.

3. I never heard a no code person every suggest CW should go
away. They just believe it shouldn't be a requirement.

4. Pro coder aguments are either emotionally based and/or false.

I have never heard a good reason for keeping the code requirement.
I don't believe that you can either. I can only think of one,
that is it might spark an interest in CW by someone that didn't
have it before.

The current mainstream Technician license class is easily attained
by young people and meets these goals perfectly; your proposed Barbie
Doll class would establish a channelized CB-like ghetto separate from
mainstream amateur radio, creating additional "we vs. them" divisions
in the Amateur Radio service. Personally, I think this is just another
spin on your attempt to establish a defacto expansion of FRS and MURS.

Maybe if you had paid more attention in class it wouldn't have
taken 15 years?

>>The fact is many have neither the ability or the self
>>discipline to learn on their own.

> I disagree. Did someone come along and inject you with your
> "superiority" knowledge or did you develop that all on your own?

You disagree that "many" people don't have the ability or self-
discipline to study on thier own?

There's NO controversy here, Len. It's a fact. Many people DON'T
have EITHER self-discipline OR ability (ie skills on HOW to study...)
to do it "on thier own".

>>They are not blessed with your tenacity and innate intelligence.

> Tenacity has no relation to intelligence.

In YOUR case, this is true. But people with a greater tenacity
to "stick with it" generally ARE more intelligent, simply because they
have applied them selves more aptly.

> I wonder why some jelly-bellies want to get chewed on...

Kinda the same reason SOME people post in newsgroups for which
they has expressed the intent to NOT be involved in, yet feel compelled
to tell others how THEY should be doing things.

> Jelly, old bean,.....

More of those "names" that you insist you don't tease and taunt
people with until they return same in kind, thereby giving you reason
to claim "VICTIM!!! VICTIM!!!"

>....I broke into HF transmissions on 1 to 15 KW tube transmitters..."

Oh geez...more of the "There I was at 30,000 feet" stories. Of
course as soon as a licnesed HAM does that, we are "resting on our

laurels", or otherwise stuck in some time warp of technology.

Try again, Lennie.

>The formality of sitting in class listening to basic training in
>English and Math (when I had already used both on the job) was a
>requirement towards a piece of paper that said I was a Bachelor
>or something......

Some of us were smart enough to "CLEP" out of those, Lennie,
saving money AND time.

>I was already a bachelor, Jelly.

More "endearments" that he denies using....WHY does Lennie lie?

> Fred JLE, don't try to "lecture" me on college-level
> "directions." Try to "lecture" me on Extra class class
> distinction and your "superiority" of CW above and beyond
> every thing else in amateur radio.

Of course YOU being the "all-knowing" about Amateur Radio of ANY
class...???

> Was it really "worth it" to sit night after night listening to some
> instructor-expert tell me what I had to know on my job when I
> was already doing my job successfully?

CLEP...DANTE....ACT-PEP.... You DIDN'T have to do it "that way"
(classroom and night school), however you DID do it because everyone
else TOLD you you HAD to do it THAT way because THAT was the way THEY
did it. And you believed them, or were too ignorant to investigate non-
traditional educational opportunities.

Thankfully, Ham Radio allows you to "do it" in numerous forms and
functions. Contrary to YOUR opinion.

> What does a student do during "homework?" Think about it.
> They SELF-TEACH by completing their assignment, showing
> their work.

Which is ASSIGNED by the instructor in a STRUCTURED teaching
enviroment, NOT one in which the "student" must attempt to glean that
which is "important". The instructor STILL "tells" the student what to
study.

> They only thing different between such self-
> teaching and self-techning from a text or informative article
> is that the instructor in a formal class will "grade" the student
> towards some achievement of a piece of paper.

Obviously you have never been an instructor or teacher, and have
no concept of the group-paced versus self-paced instructional
techniques, Lennie.

And as much as you decry the accumulation of "paper", it IS a societal necessity. Whether it is an FCC license, EMS certification or college degree..."Because I SAY I know it..." is NOT sufficient in our society.

> Which do you consider the Most Important, Mr. W4JLE,
> actually having learned-and-accomplishing something on your
> own or having an accreditation certificate or diploma hanging
> on a wall?

Hmmmm.....I did both. Did it on my own AND have a diploma and NUMEROUS certificates to validate accomplishments, learning, etc. Oh...SOME class room in there too....and it didn't take me 15 years.

> [I think everyone can see the preference but it
> would be nice to see the words of rationaliz...oops,
> justification as to which is "superior."

One need not be "superior" to the other...only appropriate to the circumstances of the "student" and the subject matter.

>>While your opinions of my stances were read and enjoyed, as always I
>>disagree with you.

> Naturally. You are so much more "superior." [barf]

More "tolerance and civil debate" from the Maximally Engineered, Non-Licensed Buffoon.

> This is a bit like nailing jelly to a tree...

And even furthermore denigration and antagonizing of someone who is NOT doing it to you.....kinda like what you dished out to me until I had enough of it.

The trailer says it all.

I don't completely disagree with that. In fact many public service agencies have gone to plain English for just that reason. I think that the intended purpose of the 10-codes and the Q codes is to save radio time. To be effective they must be learned, that's true. But once learned, they do serve the intended purpose...

> What immediately comes to mind when you hear 10-18 or QSX?

If I hear "10-18" it immediately comes to mind that my VFO is
probably *way* out of the 17-meter band.

If I hear "QSX" it immediately comes to mind that I'd better split my
VFO's if I wanna work this guy.

Dwight,

Of course you are entitled to your own interpretations and views.
However, this newsgroup is about amateur radio, not politics, relgion,
or other unrelated issues, and it is an inappropriate forum for personal
soapboxes on issues unrelated to amateur radio. I also suspect that most
subscribers to the NG probably couldn't care less about US politics or
domestic issues -- newsgroups are not just for domestic US consumption -
they're international. I'm sure there's a
"US.politics.domestic.anti-liberals" or something newsgroup somewhere
out there which is more appropriate.

No disrespect intended.

I personally know an eleven-year-old Extra. 20-wpm-code-test Extra, at
that. He was 10 when he passed the 20wpm. He was 8, IIRC, when he
passed the Tech exam.

Sounds believable to me. My 10 and 11 YOs are studying. They want to
pass the 5 WPM in time for field day.

Intel has been building "elsewhere" for many years. My wife
works for the company (IDC) that designs and builds Intel's
plants, and they currently have expansion projects going on for
existing plants in Oregon, China, Ireland, and Israel (those
that she talks about) as well as a lot more countries.

IIRC the DWP was exempt from the CPUC's fiat that production
facilities be sold. If SCE, SDGE, and PG&E were allowed to
keep their dynamos as well, would there have been a "shortage"?
Doubtful.

Dittos Larry,

The League uses phrases like: "We're protecting the service and your spectrum from external threats.", but they won't lift a finger and have no problems with watching the service rot from within.

Ed, there was already CB for those that didn't want to learn. Why did the ARRL push to dumb things down? The losers already have a radio service, why'd the League push to let them destroy my hobby?

Hey, why don't we just finger print them and give them a license. If a
young person cannot pass the tech exams today they are:

1. really NOT that interested in radio anyway
2. retarded and illiterate (I know lots of extras that fall into that
category)
3. Wanting to simply sign on dotted line for radio frequencies access.
(To my knowledge this is still a violation of ITU standards)

There are five and six year olds who have passed the EXTRA class test.
That's how easy it is to pass a ham exam with very relaxed exam
requirements.

Been there, huge complex. Must have moved into the old Martin-Marietta complex. That's exactly how cities fall into decay like the most of the Northeast Corridor cities have, the smokestackers here all bailed out for the sunbelt to a large extent get away from the unions, outrageous taxes and other expenses. Unstable power availability has to be a hot topic in the Silicon Valley board rooms.

I have to agree. As Kelley put it it's been an "experiment". A bloody failed experiment. I noticed that yesterday that Davis signed a bill which dropped the generating station spinoff requirement. The state has already dumped $1.4 billion into the fray and this is only the opening gun. Yeah, I expect there will be some steps taken back to a more viable blend of reality vs. deregulation.

There you go again making assumptions about what other people would want. It is the fallacy that has spawned all of the failures of well intentioned efforts.

The fact remains that there are people out there who rob banks every day, even though it is far easier to just go to work every day.

How do you explain that? Or does it not exist because it doesn't make sense?

The entire state of California is on a self-inflicted stage III power emergency. Most probably so that The State can scare the people into a government takeover of the grid (California Nationalists?). It appears we prefer to complain and react to symptoms rather than address the causes. The stories in the news don't make sense either, because all we're hearing right now is finger pointing and panic. It's very hard for me to beleive that this calamity couldn't have been averted at any point on a time line if only someone would have acknowledged it.

It only reinforces my observation of social calamity in spite of well intentioned assumptions.

Also, please re-read my posts in this thread. I take it you aren't getting it, or are avoiding my points.

Obsession is holding on to the belief that the train needs to go faster, even though you know in the back of your mind the tracks aren't going together as planned.

It is easiest to simply learn how to figure out the specific question from a Q&A book or use a given formula than it is to learn about how

things work and how to apply knowledge to unique problems. But then I already stated that I preferred to see an entry level ticket that requires one to gain experience before being entrusted with expanded and more permanent privileges. The Novice ticket instilled much pride in the service, and I beleive most of us that had one (pre-VE) recall a great fondness of the experience and find more respect for those who did too. If you didn't, you missed out and might never "get it".

Indeed it would be a somewhat segregated area for younger people to get started in ham radio. But that is a big part of what could make this work, as the main idea is to set up a small, less intimidating environment for young beginners, where they can work primarily among their peers, and those willing to help them learn. I have thought about what you are saying about a "we vs. them" division, such as what used to exist with the code/nocode divide(and I suppose still persists); however, I think the difference between a Colt and a Technician would be akin to the difference between a General and an Extra, and not like the old difference between a Nocode Tech and a 13wpmGeneral/20wpmExtra that was so devisive.

> Personally, I think this is just another
> spin on your attempt to establish a defacto expansion of FRS and MURS.

Well, I suppose you are right there. If something can't be done to create a better environment for kids to experiment on the virtually unused VHF/UHF bands(with the noted exception of a few high-profile repeaters), then nature will take its course, and water will follow a path of least resistance. I'm just trying to create a small area of "lower resistance" and "higher potential" for young experimenters on the ham bands, where I think it deserves to belong - rather than in the Personal Radio Services.

I look at the current "communications gap" situation that is developing between the United States and Japan/Europe in the same vein as the "missle gap" that started to develop between the USA and USSR in 1958. However, today's problem is probably more real and dangerous,

yet less obvious, and more insidious than the problem of 1958. There will be no "Sputnik" to help immediately shock us back to our senses, and therefore no equivelant to the National Defense Education Act will be forthcoming anytime soon.

I am curious - are there any hams that remember what the policy of the ARRL, FCC, and hams in general was in 1958, in regards to the issue of Sputnik? Were there any pushes back then to get more young people interested in Amateur Radio? From what I can tell, Sputnik does seem to HAVE been a factor behind the push for implementation of incentive licensing during the late 50's and early 60's. However, as is usual in the Amateur community, change occurred very slowly and painfully - with the the first real change taking 10 years to even be started to be implemented.

Interestingly enough, I found the following on the ARRL web site:

http://www.arrl.org/news/stories/2000/10/04/2/

It mentions how Sputnik spurred the creation of the NDEA and NASA(and
eventually our trip to the moon), but it doesn't mention anything about
hams, or what hams thought or did about this significant event.

Do you and your 10 and 11 YOs have FRS radios? Do they want them so
that they can talk with their friends?

You cannot escape the coexistance of the amateur radio
service with dozens of other radio services...not in spectrum,
not in service to other citizens, not in physical laws involving
radio, not in the state of the technological art of radio...and
certainly not in federal regulations.

It is one thing to be interested solely in amateur radio
history, to collect memorabilia, but it is quite another to
discuss policy on regulations which have effects with other
radio services. Insularity to the outside world is an insidious
malady which can cloud rational thought. A fascination with
the past and dedication to nostalgia can draw curtains
showing vistas of the future. Insularity to the point of walling
off all thought to the rest of the radio world can be considered
an irrational act, even terminal in extremes.

The FCC cannot be insular but must consider service to all
citizens of the US. The re-posting of the 1958 statements
on part of US Citizens Band Radio Service is proof of that.
There is some doubt that "political statements" by amateurs,
solely for amateurs is effective in changing much policy on
changes in radio regulations. The amateur media, chiefly the
largest US membership organization, must admit to coloring
issues at times.

A case in point is the "Little LEO" controversy of a few years
past. To read only the ARRL reportage, one would believe
that only the ARRL allies were commenting. As a matter of
public record by the FCC the number of Comments from

other interested parties outnumbered those of the ARRL and allies by a considerable ratio. When challenged by this, amateurs have a number of rationalizations, chiefly that it is "uninteresting, boring, or not strictly an amateur radio subject." Such rationalizations are insular in the extreme and only serve as internal boosterism that has a negative effect on the opinions of non-amateur radio services.

At WARC 1979 the controversy of Region use of the 40m band by SW broadcasters versus radio amateurs first surfaced. That controversy has been handed-off to future WARCs and WRCs time and time again. Meanwhile, amateurs have continued to complain and wave their own virtual flags of glory as some kind of "service to the community" among themselves. Not to the community, just among themselves. Insularity in action. There is no listed item in the present FCC-State-NTIA agenda for any action on this 40m controversy at any WRC. There could be...but no one seems to want to jump out of their warm cocoon of insularity to promote such an agenda.

Not too long ago the FCC invited Comments on an NPRM to restructure US amateur radio regulations. The response from the PCTAs was predictable...preserve the status quo, keep the morse code test unchanged, preserve the "incentive plan" of class distinction in licenses. Keep things exactly as they were...because that is how the PCTAs achieved their rank, status, and privileges that they hold so dear...largely achievements of their youth which were seldom augmented by further personal achievements in later life. To support their claims of "correct thought" they waved their virtual flags of glory by citing achievements of past amateurs done before they themselves were licensed. Many of those "achievements" have been biased by a few writers and a few organizations until they have achieved an Urban Myth status within the "amateur community."

One of the classics is the amateur Urban Myth is that amateurs "discovered and pioneered" the HF spectrum for worldwide radio communications. In the US that is based largely on Clinton DeSoto's 1935 book highlighting amateur radio. Later historical texts will show that commercial firms were there ahead of amateurs (not by much, to be fair). Not because of some controversy with broadcasters on MF but rather on the basis of radio technology, the state of the radio art of 1920. The Legend persists that amateurs did pioneering and later amateurs insist on grabbing whatever glory existed in the past to justify their own rationalizations of their later "superiority." Smoke dreams. Smoking is bad for the mental heatlth.

What happened in the past concerning amateur radio is just part of a progression to a future activity by amateurs. The past has stepping stones to a future struction. It is not any sort of bedrock to build a strong future upon, just an old foundation to support old materials connected in old ways when all other "buildings" are stronger, larger, and better looking. The past is prologue, not the final act.

The future of everyone begins after reading this. Embrace it, welcome it, rejoice in it, feel the excitement of new things just arrived and yet to come. Or sit back in a cocoon wrapped in virtual bunting of legendary accomplishments by others, do nothing but mumble about how inconsiderate others are about not worshiping the glorious ideals of themselves.

>made nasty remarks about your positions I disagree with.

Sorry, sport, not true.

>Why do you feel that it is necessary to make smart remarks and idiotic
>childish repartee?

Such seems to be the only thing you understand. If you jump
in with the idea of "superiority" in all radio by virtue of morse
code ability, then you've made a smart-ass remark and idiotic
repartee.

When you come back with accusations of "ignorance" insofar
as self-teching, you made a smart-ass remark and repartee.

When you come back with accusations that the US Army
never trained its signalmen, then you made a smart-ass
remark and idiotic repartee.

When you mouth off about a California state power
situation being the acts of "tree huggers" you are way out
of line and begging to be nailed to a tree.

When you make a lot of statements of intolerant morals of
generations younger than you, all the time waving some kind
of moral-ethical flag of righteousness, then you made some
smart-ass remarks and idiotic repartee.

...and that was just last week or so...

>If you cannot afford me the same courtesy I extend to you, please find
>someone else to respond to.

Nobody put a gun to your head and forced you to write a single
thing in this newsgroup. Nor does your amateur radio status
give you droit de seigneur wherein you can denigrate anyone
anywhere and expect some courtesy in return.

DOS Tip: Everybody in a newsgroup is a target. Learn that.

>Are you not capable of defending a position like an adult?

Yes, but why must anyone be defensive against patently
offensive "superior" beings?

I'm adjustable. Act adult and I can respond in kind. Act childish and I can out-write you three ways from Sunday. Some neo-militarists like to shoot at others and then complain about being shot at in return. I return fire when shot at, even if not the exact target.

If you want to parade around like only You Have All The Answers and you can Talk Down to others who don't share your personal viewpoint, TS. You are a Target waiting to be shot at by anyone. That's newsgroup Rules of Engagement. Live with it.

Len,

I don't know about "officially" requiring a license, but I have asked
for licenses at hamfests on transceivers and amplifiers. Yes, some of
'em got mad, but, knowing that Riley H. and company were roaming the
premises, I wouldn't take the risk of selling to a CBer (found that out
because the person{s} told me so).

I DO think that cash or equivilent prizes should be substituted to non-
hams at hamfests instead of handing out IC706MKIIGs to the general pub-
lic. Some of these items are sure to end up being used illegally. Some
hamfests do this, others don't---but I wish they would. Could be the
source of that "mysterious" kerchunker on 2M is a handheld won by a per-
son without a clue as to the laws governing its use.

Can't afford them right now as handy as they would be for our charity bike rides that we like to do (got into that through the ham club). Between them and their 3 brothers, it's tricky just trying to keep them in bikes plus save up for a an extra pair of 2M rigs and eventually an HF rig. Luckily they do neighborhood handywork and pay for half of their own hobby stuff, otherwise I'd never be able to afford it.

You can see them at http://www.tfn.net/~gfloyd7/cmn/

Wrong...wrong...wrong...What you need to do is have these "kids"
(as you would ANY newcomer) IN THE MAINSTREAM. They don't need to be
off in some netherworld of their own.

Part of the problem with the now defunct Novice license was that
mmany people didn't want to go up to the Novice subbands. Take a
listen there lately? THERE is your "Colt" class license right now.

In Chattanooga we have quite a few under-21 operators, and EVERY
person I hear "working" them takes extraordinary steps to be
accomodation and helpful. These "kids" are at Field Day, ARES
activities, and occassional club meetings. And I CAN'T believe that we
are the only club/community that is so disposed to do so.

My suggestion...?!?! If you haven't sent this "proposal" off to
the FCC yet, DON'T. They are going to get used to seeing your name
attached to frivolous RM's and may, in the future, automatically turn
their collective noses up on any subsequent submissions you may make,
regardless of how truly beneficial it may be.

Snippage of usual anti-Ham ranting.

The point, Oh Witless One, is that there is NOTHING NEW about
any "anti-ARRL" editorials, YOUR rhetoric notwithstanding.

Of course, a HAM made a reference to an past event, and we get the
usual "Why are you Hams stuck in the 30's" rant, yet it's OK for YOU to
dive in to one of your "There I was with 15KW tube transmitters in
1953..." stories and we are supposed to be grateful for the retelling
of the usual LHA-BS.

More Andersonian crap.

Quite the opposite would be true!

That segregation absolutely guarantees that the concept would fail!

The channelized "childrens band" would be held in disdain by mainstream amateurs, the participants would be insulated from mainstream amateur practices and procedures loosing the benefits of exposure to more experienced and skilled operators, and they would be barred from participating the host of activities which would occur outside their cozy little ghetto.

> power dissipation, would be required. Knowledge of capacitors
> and inductors would not be required.

Most telling, however, is the stupendous chasm between your stated concern about the "communications gap" and your incredibly minimilistic proposed technical requirements! Since radio today is all about digital circuitry and RF, I'd expect the tests to emphasize those areas. Instead the theory you'd require is hardly sufficient to design a flashlight! There is no mention of digital principles, and worse yet, a specific prohibition of material on capacitors and inductors (components which are the heart and soul of radio technology)! This dichotomy discredits your stated goals of "encourage basic knowledge of radio, electronics" and "provide a path......interested in further radio experimentation".

This whole thing is a non-starter, dead on arrival.

You are welcome to your delusions, Vince. I will clarify for those that don't hear that steady whoosh-whoosh of the black helicopter blades that my "retirement" points are set by ARRL employment policy and are not affected by the number of posts I make to rrap. I will clarify that my boss would probably prefer that I not post, but that what I do with my own time is my business (for the time police, I am taking an afternoon coffee break). I will clarify that what I post is my own personal opinion, and although I will not post to undermine ARRL policy, those things that I say are things that I believe. My salary is determined by the nature of the work I do wrt RFI, RF safety, spectrum, engineering studies, and supervising the ARRL Lab. Disagreeing with the doom-and-gloom folks on rrap is not on my annual performance appraisal. And, for the record, I do not go to the weekly office meeting. And last, it is the ARRL Board that sets ARRL policy, not Ed Hare in the ARRL Lab. Perhaps if you read QST more, you would better understand that. :-) Actually, I suggest that you not rely on rrap for your views of ARRL policy. There is a lot more authoratative and complete information about that on many places on the ARRL web page.

> I know you don't agree, but the proposal was a dumbing down proposal.

You are welcome to your opinion, as well, Vince. And I mean that sincerely. I agree that the requirements of going from the 6 classes of license to 4, as ARRL recommended, and the proposal to go from 0-5-5-13-13-20 wpm to 0-5-12-12 did result in a lowering of code speed standards. IMHO, although the ARRL went on record as asking that the written exams be improved so the overall level of accomplishment was the same, that proposal was general enough that I don't think anyone could really say what it meant.

I do not see that the hobby is destroyed. I can still do everything within ham radio that I could do on April 14, 2000. I do not believe that the problems I hear on the air are related to the recent changes in testing and license structure; they existed long before April 14.

In what way has your use of Amateur Radio been diminished?

They do neigborhood handywork? Man - now that is really a dying breed.

I remember I used to have a paper route when I was a kid. Nowadays the
newspapers are all delivered by adults in cars, because(I assume) there
aren't enough kids that are interested in doing it anymore.

As much as I respect your kid's work ethic, the reality is that in
today's society, the notion of having to actually work for something
has been virtually lost. I'm attempting to return to some kind

of "reward for work" ethic that reflects today's reality. The thing is - most kids aren't interested in getting on HF nowadays - because they can just get on the telephone or Internet and communicate more reliably around the world. Also, kids want to be able to communicate with their own peers(who have the same general interests). The idea is to create a critical mass of kids to make the whole thing feasible - provide a big enough carrot, and a small enough hill to climb to get to it. Obviously, we shouldn't just let anyone on who just signs their name on a piece of paper; but requiring all youngsters to have to learn about inductors is a little bit overboard, when all they want to start out with is to learn to communicate a little further than their 500mW fixed-antenna UHF rigs allow them. I want to teach them the right way to get there, and give them enough rewards that they are going to want to learn the right way to get there. This is an entryway to the Service - hopefully many will go on to get their Technician and higher licences.

I think MURS could be somewhat of a help in getting kids educated about radios - but the fastest digital speed possible on MURS will be about 4800bps(in reality 1200bps). This is not enough of an incentive. 19,200bps can be cheaply and easily done on the 1.25m/70cm ham bands, and I think that would be a VERY big incentive.

> Were there any pushes back then to get more young people
> interested in Amateur Radio?

>
There was no lack of young people then, I was one. Kids flooded into the hobby. The creation of the Novice license in 1951 was extremely successful in luring kids into ham radio. The availability and readily accesibile dirt-cheap military surplus radios and parts was another huge boosting factor. Any kid could and many did get on HF for well under a hundred bucks in 2001 dollars. Srounging was an artform and part of a perenially-broke kid becoming a ham and a lot of fun in itself.
>
Just about all large high schools had school-supported ham clubs and club stations. The 80 & 40m Novice bands crawled with other kids. A kid could actually understand the circuitry and get a soldering iron into the radios. The VHF & UHF bands were for experimentation for the most part. There were very few antenna and tower restrictions, "real people" didn't live in apartments. If you were a kid interested in electronics the customary gateway to an EE was a ham ticket. Got ya points with admissions officers.
>
Life in general was also very different from today. The overall pace of life was slower and simpler, people had more spare time. Ya didn't mess with girls until you were 16-17. There were no home computers. There were ham stores in every populated area. There was no horde of CBers, no cell phones, no Internet, endless list.
>
It's all changed and I have my doubts about how much "better off " ham radio is today vs. 1958 even though the number of hams then was some small fraction of today's license count.
>

> The old method almost required being inducted into the lodge by an
> existing lodge member in good standing.
>

I like that idea. Actually it was a well balanced approach to the situation. I never recall any Elmer putting off a prospective ham unless that person was an outright embarassement. I recall a Black kid and a Mexican kid who got their Novices about the same time. The Mexican kid burned up his radio and lost interest (probably became a professional) and the Black kid went on to General and even cobbled up a completely homebrew CW mobile on his bicycle! Another kid got his Extra and DXCC by his Senior year! But even if you were a complete outcast, you could maybe find someone else to give the test, And in 1973 you could still study and practice on your own and go to the FCC office and take the Extra Class test. I would have preferred the Elmer-Novice was the only entry.

In my case, I knew hams for several years before one asked me why I wasn't one. I had already dabbled with morse code with some of them and had some electronics experience. Actually my major stumbling block was learning the subband allocations. The Novice ticket was extremely easy if you has someone to to work with on it. Several months later I went down to the FCC office 100 miles away and took the Extra Class Exam. I flunked the code test but recieved credit for lower elements and settled for the Advanced. It wasn't till 20 years later that I upgraded to Extra. Now I don't have to sweat the subbands so much.

So why would anyone fight that? I think some people fear being rejected and so do not want to try! It also seems to me that the well meaning ARRL bunch got so hungry for bodies and subscribers that they engineered the changes on the premise that if licensing were extremely simple, then everyone would want to "join the club". The problem is, that if you go dragging the CB bands for converts and giving out licenses, Why would they want to be hams? The difference was in people getting licenses because they were hams as opposed to people getting licenses to find out if they were hams or worse, finding out that since they now have the bands, what are the use of hams.

I submit that if you go looking on Skid Row for employees, you will find a lot of people to go along for awhile, but in the end there will be quite a few that have no good use for it getting in the way of a few gems that could have, but the business failed.

Furthermore, I feel that by short circuiting the Elmer-Novice entry, a great many people have been cheated out of a foundation experience. And if you look hard at the operation of the no-coders, I bet you find that

some of them just have useless 10 year licences, and there are not many more than there were when we had 4 year licenses and non-renewable 1 year Novice tickets.

Perhaps true, but FORTY times increase in KWHR rate in
one year?!?

>> county supervisors got a new manager. The result is
>> enough electric power for this service area plus the
>> capacity to help out other areas in California.
>
>Is DWP exempt from spinning off it's generating capacity?

As a municipal agency, it can't spin off its facilities without
a lot more legal hassle than with a private electricity
provider. Right now the DWP is not only able to supply
electricity to 3.8 million customers but is also selling
nearly 9000 KWe to the outside.

One of the political idiocies going on is the LA Mayor angry
at the DWP general manager for not charging enough on
outside sale (about 6 cents per KWHR, roughly nominal
in current trading charges). It's nonsense. Mayor Riordan
is still involved in a rivalry with the Bay Area, insisting on
"showing no mercy." :-)

>extent get away from the unions, outrageous taxes and other expenses.

Lots of former Lockheed employees who stayed here insist
that Lockheed got the shaft from the state and from the
incorporated city of Burbank, Lockheed's home since 1930
or so. In one way, environmentalists were responsible for
Lockheed having had to spend an enormous sum for a water
treatement plant at the tin-bending complex off Buena Vista
(a half dozen or so large buildings, now all razed). After
completion the city wasn't satisfied with test results, wanted
much more not stated originally. Coupled with excessive
state taxes, Lockheed called it quits for corporate HQ and
moved.

>Unstable
>power availability has to be a hot topic in the Silicon Valley board rooms.

Many places large and small. Today's paper carried a story
about a store specializing in black leather clothing...rather
hard to display such wares without lighting. :-)

>I have to agree. As Kelley put it it's been an "experiment". A bloody failed
>experiment. I noticed that yesterday that Davis signed a bill which dropped
>the

> Doubtful.

Phil, the LA Department of Water and Power is a municipal
agency. "Selling" production facilities of the DWP was not,
is not, part of any plan by any California Public Utilities
Commission...or any other state group.

As of today, Friday, the DWP is selling close to 9 GWatts
of electric power outside the DWP part of the local grid.
The rest of us in the DWP service area aren't subject to
any blackouts or power restrictions.

Weirdness has surfaced politically. The DWP general
manager, hand-picked by LA Mayor Richard Riordan,
is now being criticized by the Mayor for selling at
"nominal" prices rather than raking in all they can get. :-)

I'm not familiar with details of management of SCE,
SDGE, or PG&E since those utilities were never in any
area I've lived in down here. In general, the management
of those private utilities simply failed to handle the de-
regulation of electric power trading. They seemed to be
doing okay prior to electric deregulation. No rolling
blackouts then, no "shortage," no state action needed,
was there?

All I can see is a 3.8 million subscriber municipal
agency not only supplying enough electric power for all
its customers but also selling electric power to other
power utilities. Seems to me that is a sign that DWP
management is able to deal with a situation while the

private electric utilities management were not able.

In radio terms the above is called "Proof of Performance."

It wasn't particulary relevant to ham radio much beyond a few hams becoming "Sputnik Chasers" because they knew how to use HF radios and had the equipment. The launch of Sputnik I really caught the aerospace industry with it's rado pants down and hams jumped into the vacuum for the first few days after Sputnik popped up on 15m. Beyond that the space race was pretty much a ho-hum as far as it's impact specifically on ham radio went until hams got into the game with the Oscars much later.

I suppose you didn't take the Novice exam seriously either, eh? The last version(intended to be used up to June, 2001!) contained no mention of inductors, and contained zero questions that involved a correct answer involving a capacitor.

Also, please note that this new "Novice" license does not involve any HF privileges - where the possibility of widespread interference was a possibility.

This sounds like a right wing, jackbooted, Nazi attempt to make someone work to obtain a license. We can not allow this to happen!

We should issue a license to anyone who shows an interest.

We need to be sensitive to the desires of today's youth. Are none of you able to fathom the deep loss to a young persons self esteem were they to try and fail for what ever reason.

Only a group of insensitive old hams that want to feel superior because they expended some amount of effort is keeping this from reality.

As of today I am forming NHI (No Hassle International) A group dedicated to remove the artificial barriers keeping young people from what they have a "right" to and deserve.

To fight this fight against the narrow minded ego driven old hams that are holding us down will require substantial funds.

Please send $10, $20, or what ever you can afford to my address as listed on QRZ. You can be sure the money will be put to the best possible use as determined by the Board of Directors of NHI. (Me)

Yours to rid the bands of any incentives

I have no quarrel with private property sales at hamfests. As
far as I am concerned there, a seller can ask to see a photo
ID such as a driver's license to make sure. If I was accepting
checks as payments I would want at least that kind of ID.

How do you feel about having amateur radio police at the door
of an HRO branch? Or any other store selling amateur radio
equipment? How about over the Internet store sites?

>I DO think that cash or equivilent prizes should be substituted to non-
>hams at hamfests instead of handing out IC706MKIIGs to the general pub-

I have no problem with that. Door prizes are door prizes.
Make it a round trip for two to Tahiti and I might attend. :-)

I do have a problem with such suppositions. What makes
the "mysterious kerchunker" some kind of "illegal" who isn't
FCC-green-carded? How can you tell?

Are the "illegals" always non-amateur? Does a "kerchunk"
carry any ID of the kerchunker? :-)

The thing is, the percentage of hams using HF is way down too. To be
able to reach a critical mass of other people to communicate with on
VHF/UHF, you really need more people.

My kids love the idea of HF...they've talked on sideband on CB at a
friend's house before and thought that was really neat. Maybe one of
these days, you'll hear them down there, but it will probably be on CW
because they are fascinated by the code.

When you don't understand why somebody is doing something which seems senseless to you, sometimes it pays to try to "follow the money".

In this case it led me to a company called "PubCel". According to their web site, that company is involved in:

"Wireless Entertainment and Communications Solutions:

- MURS and ARS Voice and Data Communications Systems

- FRS and GMRS Voice Communication Systems"

I think it is safe to say that the "ARS" acronym might mean "Amateur Radio Service".

Also according to their web site, the company President is none other than Stewart Teaze, N0MHS.

Suddenly this proposal for the "Barbie Doll" Amateur Radio license isn't quite so senseless.

Sarcasm noted, Fred. I'm not trying to produce a giveaway license -
but I am trying to forge a modern replacement to the lost Novice Class
license.

Maybe the right idea is to just call this class Novice, and call all
existing Novice Class operators "Novice Plus" - where "Plus" indicates
plus HF, as it does with the similarly closed Technician Plus class.
Novice Pluses would also pick up the extra sliver of privileges on 70cm.

quote:

". The idea was to spur competition, but an unfortunate sequence
of events, along with the help of some opportunistic and unscrupulous
companys lead us to where we are now. It would have been difficult to
foresee this particular outcome."

"Opportunistic and unscrupulous"? Not hardly - just the natural outcome
of a VERY flawed bit of political manuevering - BLAMING someone for
stooping over to pick up GOLD thrown at their feet is unrealistic - it
was ALL very predictable!

As a friend pointed out, the "emergency" will go away as soon as the $$$
start rolling to the "right" people - and those primary power
transmissions that were so overloaded as to require rolling blackouts
will immediately, overnite, become magically once again able to handle
to loads they had formerly been unable to...

Deregulation will continue to be the ffort here in California and other
states to follow, and the public will "benefit" from that deregulation
of electrical power JUST as we have in the area of fuel for our
transportation - you're free to buy it wherever you choose - at THEIR
price!

Sure there are, but in comparing two extremes and saying which I prefer, I felt it best not to drag in too many other factors. I do not think that those who are moderate are a major problem in ham radio.

> You Political Correct mavens insist that your choices are all there is.

Can you explain what you are trying to tell me?

> heck with the minor irritations, whatever they may be. Maybe I can learn
> something about it all from them, if I don't let the chip blow off my
> shoulder".

I do not believe that all of those who make "gaffs," to steal from another poster, have chips on their shoulder. If anything, many of those who "gently remind" people of the words they are permitted to use on repeaters (name is okay, personal is not, handle only if you are an old timer) are the ones seen as having the chips. Would it not be a lot more polite (politically correct if you really do prefer that term) to offer him the advice that some hams will think poorly of him for saying "personal" instead of "name" in a more private setting than in front of everyone on the repeater?

> It must be in the water. NO one today seems to have anything but a

> made it into the teenage years, much less far beyond.

If you are saying that no one of your generation would be offended by being publically humiliated for making a minor poor choice of words, I think you are looking at the past through some very thick lenses. Maybe you had no concern for what people think of you, but human nature has not changed that much over the decades. Many people are by nature, insecure. I don't think it inappropriate to consider that when offering "gentle advice."

There is no calamity. Governments all over America were just examining
all the piles of money from overtaxed citizens and wondering what to do
with it all. You couldn't lose in the stock market. Greenspan had to
keep tightening the money supply to slow down an over-robust economy.

Then GW won the election and the mainstream press mantra is "We're back
in the Worst Economy Ever" mode, with an energy crisis on top of it.

Actually, Aaron, it is not that human nature is even always "what it is." It is that if you participate in an open forum, there are always one or two who feel that the best thing that they could do for you is to publically and soundly berate you for any mistake you might make. It toughens the soul, you see? It will either make you, or make you go away. Either way, they believe that Amateur Radio benefits because it ensures we will end up with a "few good hams."

If you think their behaviour is inappropriate, it is only because you are too "politically correct" or never put down your love beads. :-)

The one doing the kerchunking is indeed always illegal. Transmitter fingerprinting has been used to successfully ID several kerchunkers over the years.

You may be right that most who learn the code will actually possess equipment to use it, if they stay active as hams, but I know many a code-tested ham who has no equipment at all, as well as a few who literally had the code-key burying cermony in their back yards, surrounded by all their friends. I also know a larger number of hams who passed a 13 wpm test, but would have difficulty getting past 5 wpm today.

Your mileage may vary.

The ARRL's proposal to the FCC was for 4 license classes, 0, 5, 12 and 12 wpm, and that the level of the written exams be increased to make up for the changes in code testing. Not exactly the most "extremely simple" structure I could think of.

If you want extremely simple, go back to 1963, when I studied 4 pages of study guide to become a Novice, then to 1964 when I studied 16 pages of study guide to become a General. Nowadays, we hand prospective hams a study guide that is over 200 pages and tell them that this is what they need to know to be a beginner. I don't know about the current edition, but in the previous Now You're Talking, the question pools took up about 70 pages. Four pages vs sixteen pages vs over 200 pages. Which are you calling "extremely simple" again?

> The problem is, that if you go dragging the CB bands for converts and
giving out

No one is giving out licenses; those wishing to be hams are studying hundreds of pages of study guide and passing tests.

I agree; the lack of Elmering cost us a lot of hams. So did an "Elmering" process by which some hams made newcomers feel like they were seen as having

come from "skid row..." I don't know which had the larger effect.

Ed,

I hope, IF the test is an issue, that some ARRLer with a testing and measurements background (more current than mine) would, indeed, offer to assist with the development and validation of the test pool. If not, so be it.

Frankly, the only problems that I have with the General pool (which I'm working on right now) are the numbers that I have to (MUST) memorize. There's just some background knowledge not in the study guides that a non-techie like me doesn't have and doesn't know where to find the answer, other than memorization. For example, one of my Monday night buddies showed me how to figure out the band from the frequency. I've looked for that in my study material and just can't find it. There are lists to memorize, but an explanation?

Thanks for your participation in all of these threads. I'm getting too old to have fun with the trollers, though <grin>.

What for? The present Technician grants "tons" of priviledges
over what you are proposing, and if the licensee passes the 5WPM, the
FCC has already said it's OK to add the "plus" part as long as you keep
the CSCE in your possession.

Noble effort, Don Quixote.

I've never tried to hide the fact that I'm trying to create a
business. Quite the opposite - why would I list the web site on the
signature to all my posts, if I was trying to hide something

Hey, Hans, I wonder why you switched your approach to this slimly
veiled "personal attack"? It couldn't be that I was right about the
point regarding inductors and capacitors on the Novice test, could it?

Let's stick to the point at hand. You made a good point about the lack
of digital modes in the proposal - THIS is the kind of stuff I'm
looking for.

Not true. MURS allows external antennas and digital modes. These are
big differences over simple FRS.

If ARS is to "compete" with MURS, we are going to have to come up with
something new.

Every year, I have generally offered some input to the ARRL HQ folks who work with Bart Jahnke, the ARRL representative on the QPC. Unfortunately, I have only limited time to spend on that. I sure wish that more people would weigh in and give the QPC their input on what changes are needed on the pools.

I went to the ARRL General Class manual, and lo and behold, there was no info about wavelenght.

So, let me give it a whirl.

Electromagnetic or radio waves can be visualized just as waves in water. If you put your hand in the water and move it very fast, small ripples will move from your hand, away in all directions. If you move your hand more slowly, the ripples move just as fast, but are spaced farther apart. The distance between the peaks (or valleys) of the ripples is the "wavelength" of the waves you are creating, and this wavelength is related to the speed the wave is traveling and how fast you are wiggling your hand. The wiggle rate could be expressed in "wiggles per second," thus expressing it as a frequency.

The "hand" being used to generate ripples in electromagnetic waves is usually a transmitter. The the transmitter is generating an electrical AC signal, at a fast enough rate to be called "radio frequency" (RF). Rather than expressing it as "wiggles per second," the transmitter rate is expressed in "cycles per second." The unit for cycles per second is Hertz, abbreviated "Hz." This RF signal, when applied to an antenna creates an electrmagnetic wave. To round off just a bit, the wavelength is related to the speed of the wave and the frequency by the formula:

wavelength in meters = 300,000,000 meters per second / F where F is the frequency in Hz

This is a bit cumbersome. An easy way to calculate the wavelength in meters is to use the formula:

wavelength in meters = 300 / F where F is the frequency in MHz (the M comes from the metric system, for Mega or 1,000,000 times the basic unit).

So, to try this for a few frequencies in the ham bands, you end up with:

3.5 MHz = 85.7 meters
4.0 MHz = 75 meters
7.0 MHz = 42.9 meters
10.1 MHz = 29. 7 meters
14.0 MHz = 21.4 meters
144 MHz = 2.1 meters

The "frequency" of a particular signal can be expressed either as a frequency, as in 14.0 MHz or as a wavelength. Either one says the same thing. You probably notice that the wavelength numbers are pretty close to what hams call 80 meter band, the 75 meter band, the 40 meter band, the 30 meter band, the 20 meter band and the 2 meter band. Although the exact wavelength for the 3.5 MHz signal is 85.7 meters, hams have rounded these bands off to a convenient number and use those rounded numbers in common reference to the bands.

Memorizing the bands works just fine; in fact, most hams, even Extras, really don't think much about the relationship between frequency and wavelength in common speech. You will soon refer to the 80 meter band with complete ease as you think about frequencies; it becomes second nature. You will think of that wavelength relationship when you think about antenna size -- a half-wave dipole (neglecting factors that make a "real" dipole a little bit shorter than its electrical length) is, well, a half-wavelength long. So an 80-meter band half-wave dipole is about 40 meters long.

But if you would rather figure out the answer when you take your test instead of memorizing it, memorize the following two formulas (or just the first one and apply a bit of simple algebra and solve for the unknown):

wavlength in meters = 300 / F

F = wavelength in meters / 300

Is that easier than all that memorizing? :-) I hope my few paragraphs helped you understand it. Don't worry, when I took my 1964 General exam, I memorized the formula without understanding it. You are one step ahead of where I was when I first started. :-)

If you have any more questions about the theory, go ahead and email me at home, w1rfi@aol.com. I only check my home email every few days, but I will try to point you in the right direction, if I can.

Good luck on your General.

Some of us have more experience in that than others, I guess. :-)

Those who use the MURS radios will learn something in the process. First, the radio has a range. They will learn that buildings and obstructions limit that range. They will learn that the range is farther if you are at the top of the building than if you are in a valley.

I think a better analogy that the porn chat room (where did you dig that one up) would be to ask what education has been the result of giving kids internet access in general? As a big kid, I can't begin to describe how much I learned that way.

> You turn on the box, select a channel and talk.

That is indeed most of the picture. Now, can we use the good and bad of MURS to find the subset of those kids that don't yet know they would like to be hams?

I wonder if it would be possible to get the text of the arguments made for the successful creation of this license class back in 1951. Even though they would be 50 years old, I am sure there would be some relevant ideas.

This stuff must be archived in Washington, DC, somewhere. I would think it would have been put on microfilm a long time ago. Does the FCC have a library for this kind of thing?

Digital modes aren't boring. Having a computer make your carrier hop
around just for the heck of it seems kinda dull though. I guess it
would be fun the first time you actually got the thing to work though.

Stewart,

The idea has already been tried. Back about 15 or 20 years the Dutch instituted a license class for beginners. It consisted of about 5 frequencies in the two meter band. Licenses required only a simple test. No code. It was hoped that these Novices would upgrade and become regular licensees. As for as I know none ever did. The service still exists, I believe.

If you want to have youngsters or oldsters learn about radio the best way is the old Novice license. % wpm code, a simple theory test, and a one or two year limit within which they HAVE to upgrade!

I had promised to find this and post it.

73,
Ed Hare, W1RFI
ARRL Lab

ARRL Study Guide - 1963 - Copyright 1963, American Radio Relay League, Inc.
All rights reserved.

CHAPTER 2

The Novice License

The Novice Class license offers an ideal way to get started in amateur radio -- reduced code speed and a simplified written examination. It grants a portion of amateur privileges on an "apprenticeship" basis for one year. The examination is available only by mail. This chapter explains the license in detail and contains sample questions for the written exam.

In an incentive to encourage a greater number of people to engage in the hobby of amateur radio, the Federal Communications Commission has established a Novice Class of license with greatly reduced requirements and only a few of the privileges available to amateurs. This class of license might well he termed an apprenticeship. It has a term of but one year, compared with the five-yea terms of other amateur licenses, and the objective is to give a newcomer a period of a year of actual on-the-air experience or training in amateur operation so that he may develop his skills toward one of the permanent classes of license more rapidly than he would by textbook study and audio-oscillator code practice.

The Novice Class license examination may now be taken only by mail, under the direct supervision of an amateur holding a General Class license or higher, or a commercial radiotelegraph license. This is true no matter where the applicant lives. Refer to the section "Examination Procedures " in Chapter 5 for details on the rules governing the routine for making application and obtaining a set of examination papers. Requirements for the Novice license are the passing of a code test in sending and receiving at the rate of 5 words per minute, and a written examination in the most elementary aspects of amateur regulations and theory.

The privileges which are currently available to the Novice licensee are:

3700 3750 kc. - telegraphy
7150-7200 kc. - telegraphy
21,100-21,250 kc. - telegraphy

145-147 MC. --telegraphy or voice

In addition, the transmitter used by a Novice licensee must be crystal-controlled, and may not have an input exceeding 75 watts. Of course, the Novice may operate portable or mobile on any of these frequencies. (SeeChapter 7).

The most important point concerning the Novice license is that it is valid for only one year and may not be renewed. Before the end of his license term the Novice must qualify for one of the other grades of amateur licenses, or go off the air. He may try for a Technician Class or a General Class license (or Conditional Class, if eligible to take the mail examination). Whatever his choice, he must qualify for all requirements of the particular license class inasmuch as the Novice Class license, being obtained by mail, carries no credit toward a higher grade of license even where the examination elements are identical (such as the Technician 5 w.p.m. code test). He may not try for a class higher than those mentioned, of course, since experience as a Novice operator does not qualify for the service requirements for the Extra Class license.

Anyone who is a citizen of the United States may apply for the Novice, license, except a person who holds or ever has held an amateur license of any class. Thus a Novice not only is unable to renew his license at the end of his term, but he may not again apply for Novice privileges. If an applicant for Novice privileges feels that he can pass the standard written examination for amateur licenses but is unable to meet the 13 w.p.m. code requirement, he may simultaneously apply also for the Technician Class of license, taking the 5 w.p.m. code test, the elementary Novice written exam, and the standard written exam.

A Novice may operate any FCC-licensed amateur radio station, but only to the extent of the privileges available to the Novice and similarly available to the licensee of the station being operated. For example, when a Novice visits a station licensed to a General Class amateur, he may operate in only the Novice bands, using crystal control and with 75 watts input power or less. He uses his host's call sign exactly as issued, however. When a Novice operates a Technician's station, he may use only the 145-147 Mc band, since that is the only band common to both Novices and Technicians.

As stated, the written examination for the Novice license is quite simple. It consists of about 20 questions dealing with basic amateur regulations, and certain points of theory and technique. The questions are of the "multiple-choice" type, as explained in Chapter 1. There are no diagrams required. Following is a set of questions similar to those which are asked in the examination. If you are thoroughly able to answer each of these sample questions, you will have no difficulty in passing the written exam. However, in any event we recommend additional study of at least the technical material in How to Become a Radio Amateur and preferably of the introductory chapters of The Radio Amateur's Handbook ($3.50), both available postpaid from the ARRL, West Hartford 7, Conn.

The receiving code test for the Novice Class license consists of 25 five-letter words, mostly common ones. No punctuation marks or numerals are included. To pass, the applicant must copy at least 25 consecutive letters accurately. In the sending test, numerals and simple punctuation marks may be included.

QUESTIONS:

1. What is the maximum input power permitted to the final stage of the transmitter in a station licensed to the holder of a Novice Class license or operated by such an operator?

The maximum input power permitted a Novice is 75 watts.

2. What is the maximum penalty for a violation of the rules and regulations of the Federal Communications Commission?

A fine of up to $500 for each day during which the offense occurs, suspension of operator license, and revocation of station license.

3. On what frequency bands may the holder of a Novice Class license operate an amateur radio station?

3700-3750 kc.
7150-7200 kc.
21,100-21,250 kc.
145-147 MC.

4. On what frequency bands may the holder of a Novice Class license operate an amateur radiotelephone station?

5. What is the log of an amateur station, and what information is required to be entered therein? How long must it be preserved ?

The log of an amateur station is the written record of transmissions. The log must show:
1) the date and time of transmission
2) the signature of each licensed operator operating the equipment and the name of any person not holding a license who speaks over a radiotelephone transmitter directly or by recording, or operates a teleprinter keyboard
3) call of the station called
4) the input power to the transmitter
5) the frequency band used
6) the type of emission used
7) the location of the station at the time of transmission
8) the message traffic handled

Information such as the input power, frequency band, type of emission, location of station, need be entered only once provided the conditions are not changed. Similarly, one entry of the date need not be repeated for other transmissions made on that date. If the station is mobile, the approximate geographic location can be indicated in the log.

The log of an amateur station must be preserved for at least one year following the last date of entry. Similarly, any message traffic handled must be kept on file for at least one year.

6. What is the term of an amateur Novice Class license? Under what conditions may this license be renewed?

The term of an amateur Novice Class license is one year. It may not be renewed under any conditions.

7. What are the rules and regulations regarding the transmission of improper language, false signals, or malicious interference?

The transmission of obscene, indecent or profane language, or of false or deceptive signals or call letters, or of malicious interference is expressly prohibited and there are heavy penalties for violation.

8. What are the rules and regulations regarding purity and stability of emissions?

Below 144 megacycles, spurious radiations must be reduced in accordance with good engineering practice, and must not cause interference to near-by receivers of good engineering design not tuned to the transmitter. Voice modulation of a transmitter must not cause spurious emissions; the maximum modulation percentage is 100%. Simultaneous frequency modulation and amplitude modulation is not permitted. The frequency of the signal transmitted must be as constant as the state of the art permits.

9. What method of frequency control is required to be used in the transmitter of a station licensed to the holder of a Novice Class license?

The frequency must be crystal-controlled.

10. What are the rules and regulations regarding the measurement of the frequencies of the emissions of an amateur radio station?

Regular measurement of the frequency of the transmitter is required. This measurement must be by means independent of the means used to control the transmitting frequency and must be of sufficient accuracy to ensure operation within the frequency band used.

11. Who may be permitted to operate the transmitter of an amateur radio station licensed to the holder of a Novice Class license?

Any amateur radio operator (though a Technician may operate a Novice's station only in the band 145-147 Mc., since that is the only band the two classes have in common).

12. Under what circumstances may an amateur radio station be used by a person who does not hold a valid license?

A person not properly licensed may not operate an amateur station. However, he may speak over the microphone of an amateur radiotelephone station or use the keyboard of an amateur radio-teleprinter, provided a duly licensed operator is present to control the emissions.

13. What is the maximum permissible percentage of modulation of an amateur radiotelephone station?

One hundred per cent.

14. At what intervals must an amateur station be identified by the transmission of its call sign? May any transmission be made without identification of the station?

An amateur station must identify its call sign at the beginning and end of each transmission and at least every ten minutes if a single transmission lasts longer than ten minutes. No transmission by itself may be made without identification of the station, except that during a sequence of transmissions each less than three minutes long, the call sign needs to be given only once each ten minutes as well as at the beginning and end of the work.

15. Under what conditions is notice of portable or mobile operation required to be given, and to whom in each case?

Notice of intended portable operation, or mobile operation, must be given the FCC Engineer-in-Charge of the inspection district in which such portable or mobile operation is contemplated only when the operation is or is expected to be for a period longer than 48 hours.

16. What are the recognized abbreviations for: kilocycles, megacycles, Eastern Standard Time, Greenwich Mean Time, continuous wave, frequency modulation, amplitude modulation?

kilocycles - kc.
megacycles - MC.
Eastern Standard Time - EST
Greenwich Mean Time - GMT
continuous wave - C.W.
frequency modulation - f.m.
amplitude modulation - a.m.

17. What is the relationship between a fundamental frequency and its second harmonic; its third harmonic, etc.?

The second harmonic is twice the frequency of the fundamental, the third harmonic is three times the fundamental frequency, and so on. A harmonic is always related to its fundamental frequency by an integral multiplier; i.e., 2, 3, 4, 5, 6, etc.

18. What is the relationship between a cycle, a kilocycle, and a megacycle?

1 kilocycle = 1000 cycles
1 megacycle = 1000 kilocycles = 1,000,000 cycles

19. What instrument is used to measure: electrical potential; electrical current; electrical power; electrical energy?

Electrical potential is measured by a voltmeter.
Electrical current is measured by an ammeter, milliammeter, or microammeter.
Electrical power is measured by a wattmeter.
Electrical energy is measured by a watt-hour meter.

20. What is the purpose of: a modulator; an amplifier; a rectifier; a filter?

A modulator is used to vary the amplitude, frequency or phase of the output of a transmitter for the purpose of transmitting information. An amplifier is used to increase the amplitude, or power level, of a signal. A rectifier is used to change alternating current into pulsating direct, current. The purpose of a filter is to attenuate undesired frequencies while simultaneously passing, without appreciable attenuation, a desired band of frequencies and/or direct current. Examples: The power-supply "smoothing filter," which eliminates the alternating-current ripple from the output of a rectifier but permits direct current to flow with little or no attenuation; the "low-pass" filter, which attenuates all frequencies (such as harmonics of a transmitter) above a given frequency but passes all lower frequencies.

21. What is meant by: amplification; modulation; detection; attenuation?

Amplification is the process of increasing the amplitude, or power level, of a signal. Modulation is the process of varying the amplitude, frequency or phase of the radio-frequency output of a transmitter. Modulation is normally employed for the purpose of transmitting information. However, it may also occur inadvertently, as in the case of "hum" modulation of a signal resulting from ripple in the output of an insufficiently-filtered d.c. power supply. Detection or demodulation is the process of extracting the information contained in the modulation on a radio-frequency signal. Attenuation is a reduction in amplitude.

22. What is the purpose of: a radio-frequency choke; an audio-frequency choke; a filter choke?

The purpose of a radio-frequency choke is to oppose the flow of radio-frequency current while permitting direct current and audio frequencies to flow without appreciable opposition. The purpose of an audio-frequency choke is to oppose the flow of audio-frequency currents while permitting direct current to flow. The purpose of a filter choke is to aid in smoothing the direct-current output of a rectifier.

23. How is the actual power input to the tube or tubes supplying energy to the antenna of an amateur transmitter determined?

The input power is determined by measuring the direct-current plate voltage and the d.c. plate current to the tube or tubes in the final stage in the transmitter. The power input is equal to the plate voltage multiplied by the plate current in amperes. Example: Two tubes in the final stage of the transmitter take 50 milliamperes each, at a plate voltage of 500 volts. The total plate current is 2 X 50 = 100 milliamperes, or 0.1 ampere. The power input is therefore 500 X 0.1 = 50

watts.

24. Why are a rectifier and filter required in the plate power supply system of an amateur transmitter when operated from alternating current?

The amateur regulations require that an adequately-filtered plate supply be used on transmitters operating below 144 Mc. The rectifier is used to convert the alternating current into direct current. However, its d.c. output is pulsating, not constant, and the filter must be used to smooth out the pulsations so that the output is essentially "pure" -- that is free from pulsations or "ripple."

25. What is a frequency multiplier?

A frequency multiplier is a device that delivers output at an integral multiple (i.e., 2, 3, 4 times, etc.) of the applied frequency. The output of a frequency multiplier is consequently on a frequency that is a harmonic of the fundamental (applied) frequency.

26. What are the undesirable effects of overmodulation in radiotelephony?

Overmodulation results in the generation of spurious sidebands - that is, frequencies lying outside the band of frequencies or "channel" actually required for transmitting the information contained in the modulation. Those spurious frequencies, called "splatter," will interfere with communication on near-by channels and may even lie outside an amateur band. At close range they may also cause interference with broadcast reception.

27. What is meant by a "parasitic" oscillation?

A parasitic oscillation is one not essential to the operation of the equipment and usually occurring on a frequency considerably removed from the operating frequency.

28. What is the purpose of a "key-click filter" and when should it be used?

The purpose of a key-click filter is to reduce spurious radiation generally when keying a radiotelegraph transmitter. It should be used whenever required for suppressing such spurious radiations.

29. What is Ohm's Law?

Ohm's Law expresses the relationship between potential, current and resistance in any circuit.

It is stated as I = E / R where I = current in amperes, E = potential in volts and R = resistance in ohms. By simple algebra it is also E = I * R and R = E / I.

30. What precautions should be taken to avoid the danger of shock from high-voltage electrical circuits?

Such circuits in transmitters and receivers should not be exposed where the operator can inadvertently come in contact with them when the power is turned on. All work on equipment involving the possibility of contact with such circuits should be done only after the power has been turned off. All power-supply capacitors should have bleeder resistors connected across them, to discharge the capacitors after the power has been turned off.

31. What is the relationship between the frequency and the wavelength of a radio wave if its velocity in space is 300,000,000 meters per second?

The frequency in cycles multiplied by the wavelength in meters is 300,000,000. Therefore, the wavelength is inversely proportional to the frequency; in other words, the longer the wavelength, the lower the frequency. The formula for calculating frequency (f) in cycles when the wavelength in meters is known is f = 3,000,000 / wavelength ; similarly, wavelength = 3,000,000 / f. Example: The wavelength of a signal whose frequency is 3700 kilocycles is 300,000,000 / 3,700,000 or 81.08 meters.

32. What symbol is used in the amateur rules to designate amplitude-modulated telegraphy without the use of modulating audio frequencies (on-off keying)?

Al. (The "A" indicates amplitude modulation, and the numeral "1" is used to indicate telegraphy by on-off keying).

33. What is the ruling regarding eligibility for reexamination?

An applicant who fails an operator examination may not take another examination for the same or higher privileges within 30 days (except that this does not apply to an examination for a General Class license following a mail examination for a Conditional, Novice or Technician Class license).

34. What factors are commonly responsible for harmonic radiation and what practical means can be used to detect and correct such condition?

The principal factors responsible for harmonic radiation are (1) improper operating conditions in the final amplifier, such as excessive grid bias and excessive drive, causing the tube or tubes to develop unnecessarily large harmonic output: (2) poor selectivity interstage tank circuits, resulting in excessive harmonic content in the excitation voltage applied to the final stage (3) inadequate selectivity in the final tank circuit because of too-low operating Q; and (4) insufficient selectivity in the coupling circuit between the final-amplifier tank circuit and the antenna, or omission of such a coupling circuit.

These defects can be corrected by (1) reducing grid bias and drive to the minimum necessary for reasonably efficient operation of the final tube or tubes; (2) using higher-Q interstage circuits, usually by increasing the ratio of capacitance to inductance or by decreasing the coupling to lighten the loading on the circuit; (3) adjusting the final tank inductance so that the tuning capacitor will be set for higher capacitance at the operating frequency: and (4) installing a tuned

antenna-coupling or matching circuit between the transmitter and the transmission line or antenna.

The presence of harmonics in the output of a transmitter can be detected by the use of an absorption wavemeter, having a sensitive indicator, coupled to the final tank circuit or to the antenna coupling circuit, and successively tuned through the harmonics of the operating frequency. Alternatively, tests can be conducted with a nearby amateur station, with the cooperating amateur listening on the various harmonic frequencies while the transmitter is in operation. The receiving station should not be so close that the fundamental-frequency signal strength will be such as to overload the receiver and thus cause spurious harmonic responses in the receiver itself.

>Phil, the LA Department of Water and Power is a municipal
>agency.

It is well established law that a governmental agency that is
engaged in a commercial activity that is equal to or in direct
competition with similar private sector enterprises does not
automatically enjoy "exempt" status that governmetal agencies
otherwise enjoy. The Legislature or the CPUC has to grant that
status, usually by the use of the term "investor-owned utilities"
in either the statutes or CPUC Orders.

"Selling" production facilities of the DWP was not,
>is not, part of any plan by any California Public Utilities
>Commission...or any other state group.

That's what I said.....

>As of today, Friday, the DWP is selling close to 9 GWatts

9 GW is 9000 MW....equal to NINE units of nuclear power
plant generation (1 "unit" is 1000 MW). Five plants the size
of Diablo Canyon. Hard to believe. Where are they hiding them?

The only way it might help is if they have an Elmer type to explain what is actually happening when they talk. From that standpoint, CB would be better because at least they can practice antenna and electronics theory (especially if they get busted radios donated for practice demolition er I mean repair), and there's at least a little bit of propagation that might get their attention and give them something more to learn about.

At the same time, having adult supervision would be even more necessary in case "emergency censorship" of the ongoing conversations become necessary.

Everybody is holding their breath until the Motorola objection to FCC's creation of MURS is settled. If that gets settled positively (Motorola's objection is set aside), then I expect many manufacters to begin making MURS radios. Prices will drop, accordingly. I expect that within a year we will see decent MURS radios in the $70-$100 range. Right now the only thing specifically available are offerings from Radio Shack in the $125 range, or the 1W Motorola Spirit single channel(9 selectable)VHF business radios(don't get the two watt version, it is not useful for MURS, as the only two MURS specific channels it supports use a 25Khz bandwidth, MURS will be using 12.5).

Didn't say that. Go back and read. Again - I said the percentage of hams using HF is down. I would guess that the number using HF has remained fairly constant. As you know, those that are using VHF/UHF communicate over shorter distances - it is these people who I am talking about. Every year they become a greater and greater percentage of the ham population. The problem is that less and less of all hams are ACTUALLY using VHF/UHF.

I originally posted to rec.radio.cb to support my argument that CB is
obviously NOT the proper environment to be starting our kids off in
radio - and you folks did not disappoint me, as the typical vulgarity
of your posts show.

Look, I don't have anything against you folks - I just don't think it
is appropriate for kids to be learning radio on the 11 meter band.

For once a constructive suggestion! My 11 year old has asked me several times if I can find a ham radio technician text that is geared for young people. So far I haven't found anything. Anybody for getting something like this together? It doesn't need to talk down to the kids. Kids are bright and intelligent and can understand amazing things. But it HAS to be made interesting to THEM. If you could disguise it in a Nintendo game it would work even better. If it were available for download for a free or minimal cost so much the better. Now THAT would be a contribution!

Dunno how "cool" it is but it was a poke at demonstrating why us Old Farts come from fundamentally different "cultural" directions than do many of the much younger hams of today. I mean like the whole point to RRAP is that it's the current really whizzy outlet of convenience for the usual generational warfare which probably goes back to when the first Species Homo Sapiens kid told his father he wasn't gonna sleep up in the freaking family tree any longer.

I guess so considering the big volume of hams today which don't have HF privs which was not the case in earlier days. .
>
Fact is that there isn't any way to put the calipers on HF activity and band utilization. If I had the time I could spend all day every day on HF and barely even scratch the surface. Over the past half century four MF/MF ham bands have come into broad use thus there is something of a dilution effect, basically a 55% percent increase in the size of the playground. We got the three WARC bands in '79 which accounts for three new bands plus 160 has returned from the deep dark "200 Meters and Down" days into a very current hot button.
>

The Tech license also came out of that "restructuring" maneuver.

No. Regulatory agencies are not keepers of history. It's all in the ARRL
collection of QSTs now archived in CDs going to the 1915 issue one, volume
one, in particular cruise the Letters to The Editor columns for the
earlier iterations of rrap. Heh.

I don't remember any policy. I was a teenage ham at the time. I
remember listening to Sputnik on my old receiver and thinking it was
pretty neat...

>Were there any pushes back then to get more young people
>interested in Amateur Radio?

That was not a problem then. One old magazine I have estimates that
about 50% of the new hams in the late 50's were teenagers...

I am not trying to escape the totality of radio. My posts here are mostly are about *amateur radio* because this is an *amateur radio news group* and because *amateur radio* is my hobby interest. If I wanted to hear about broadcast radio, CB radio, SWLing or other radio subjects I would specifically visit those particular groups...

But...goodness knows we do stray from the subject, so feel free to post on the totality of radio. I certainly have no objections. Just don't expect all of us to do so... :-)

I was referring to my first line above:
"In society most people are too polite to tell
someone about his gaff."

You were too polite to tell a CW contact that he had a poor fist. You were so polite that you would rather lie about having to QRT to go dinner than tell him about his bad fist. That's not much different from being too polite to tell someone about his gaff... :-)

Len insists on his "rights" Aaron. He feels free--nay, he insists on his "right" to post his usually lengthy diatribes in an amateur radio group. He isn't a ham but seems to think that radio amateurs are under some sort of obligation to pay credence to his views. You'd think that if the guy was really interested in amateur radio, he'd have managed to obtain a license by now.

You'd think he might have figured out by now that most of the folks reading and posting here are really interested in amateur radio.

Well, it depends on how ingrained they became.I still remember 10-18
though I haven't used it in 15 years. It meant "what is your location?".

I have an APCO "National Police Communications Network Directory and Reference Guide" from 1945, and one from 1951. It's amazing how much changed in that six year period.

Why don't they make some effort to do more with geothermal energy? Ca.
is loaded with the stuff and there's no natural gas bills involved. Too
simple a solution?

I know there is some geothermal installations in northern CA but looks
like it would be -or would have been- an easy out for them all along...
Guess that's too much to ask from politics, 'specially on the Left
Coast. No "vested interests" in geothermal as in oil and gas.

So was I, old-timer. :-) But...back then, to "kids" (and quite a few
grown-ups) circa 1950s, radio was a sort of black magic with
wires, solder, and things that glowed in the dark.

> The creation of the Novice license in 1951 was extremely successful
>in luring kids into ham radio. The availability and readily accesibile
>dirt-cheap military surplus radios and parts was another huge boosting
>factor. Any kid could and many did get on HF for well under a hundred bucks
>in 2001 dollars.

In 1951 an ARC-5 receiver in the domestic shipping carton was
$6 at W9ERU's H&H Electronics in Rockford, Illinois. An ARC-
5 transmitter was $12 and the antenna coupler and modulator
was $18. Surplus BC-348 receivers were terribly expensive at
around $49 while a less-technically-able National NC-57
"Communications Receiver" cost $98 list. In the dollars of
those days it still represented a sizeable fraction of income.

>Just about all large high schools had school-supported ham clubs and club
>stations.

Maybe in your area, but not in mine, a city of about 80
thousand back then.

>The 80 & 40m Novice bands crawled with other kids.

Really? My experience was a lot of WW2 vets were doing
the crawling.

> A kid could
>actually understand the circuitry and get a soldering iron into the radios.

100 Watt American Beauty irons. Yeah, sure... :-)

>There were
>very few antenna and tower restrictions, "real people" didn't live in
>apartments.

No problem, there were very few antenna towers. :-)

> If you were a kid interested in electronics the customary
>gateway to an EE was a ham ticket.

Oh? Of five in my high school class of 1951 that became
EEs, none of them had ham tickets then. I'll check up on
that in August when my class has its 50th reunion... :-)

>Life in general was also very different from today. The overall pace of life
>was slower and simpler, people had more spare time.

Nonsense. People back then were saying the same thing
about those of 50 years past.

>Ya didn't mess with girls until you were 16-17.

More nonsense. :-)

>There were no home computers. There were ham
>stores in every populated area.

I can drive 2 miles to an HRO outlet in Burbank, CA. It's in a
mini-mall across Buena Vista from another mini-mall. :-)

>There was no horde of CBers, no cell phones, no Internet, endless list.

Let's look at the state of the art of radio for amateurs in 1958.
Vacuum tube technology for everything. Rock-bound
frequency control...deluxe was a VFO. No direct-reading
frequency meters. Sharp-selectivity IF filters was only just
starting and they were expen$ive. One had to wait at least
20 minutes until everything warmed up to reduce the drift.
Almost everything was HF since VHF and above was the
Twilight Zone inhabited only by gurus and wizards. :-)

One peaked the PA grid, dipped the PA plate and the PA
output was a pi-network for an under-150 Watt rig. Want
to have a multi-band HF transmitter? Good luck. Those
were not common at all unless there was Money. There
were more Urban Legends on technology than there was
textbook information for anyone, amateurs included. The
commercial people making things for HF were small in
number but high in experience...on tube technology.

>It's all changed and I have my doubts about how much "better off " ham radio
>is today vs. 1958 even though the number of hams then was some small
>fraction of today's license count.

What did amateurs have in 1998? Multi-band HF rigs, a
few of which could hit 6m. Frequency control was rock-
solid on ANY frequency, any band. Solid-state PAs
that didn't require touchy-touchy tuning at the higher HF
bands. Sharp-skirted crystal filters for receiver selectivity,
DSP for brick-wall filtering. Very high 3rd order IM
characteristics and sensitivities down to noise level of
50 Ohm impedances. Push-button modulation selection

of CW, AM, SSB, or FM. All kinds of towers and beams
and rotators available for purchase, you install or hire
somebody for grunt work. No problem. Want VHF or
UHF? No problem there. Select a band or two and there
is a rig available. Want an HT with rechargeable battery?
No problem...lots of bells and whistles in a little box.
Need an antenna tuner? No problem, take your choice of
manual or automatic, be able to read forward or reverse
power at a glance. All ready to go out of the box.

Anyone who wants to go back to 1958 is nuts!

>will be no "Sputnik" to help immediately shock us back to our senses,
>and therefore no equivelant to the National Defense Education Act will
>be forthcoming anytime soon.

I don't understand this "communications gap" that is supposed
to be developing. What has been going on is rather intense
competition for commercial communications all over the world.
For a long while Asia has been leading that area due to low
production costs. Now north Europe is cutting into that market.
A cross-country drive across 2/3 of the USA will demonstrate
that, via all the antenna poles and towers that weren't there two
decades ago, the USA has been adding communications
facilities aplenty. I don't recall seeing any foreigners coming
into the USA to install all that equipment.

If one can get the gist of this alleged "communications gap,"
it does not impact amateur radio. All of that commercial
communications infrastructure was put in by commercial
communications workers, trained by commercial
communications firms. The active and passive devices used
in all that commercial communications has been largely
developed in the USA. Want technical information on that?
Go to the USA component makers' websites. Plenty of
data available. Input from USA radio amateurs was a
virtual zero...the whole infrastructure is commercial, not
amateur.

Is there some kind of insidious "missle gap" or equivalent
now? 43 years after 1958? I don't think so in the military
or commercial communications of the USA. The USA
has learned to live with the threat of nuclear warfare and
intercontinental ballistic missles...and has long since come
up with a counter to that, the rather horrifying MAD. The USA
has a rather strong military...whose communications is not
modeled on any amateur radio standards and practices.

Somehow, in all the 43 years since 1958, this tremendous commercial-military structure has been created without having to interest "young people" in fun amateur radio to provide some sort of base of radio knowledge. Radio has evolved rather far since tube days and old analog radio technology has become much more electronic in nature, including digital techniques so much that there is little differentiation between analog and digital.

The existing Novice class license has been failing for years. The negative trend numbers are clearly visible. The existing Novice class license has been around for a long time and no one has bothered to "fix" it to attract enough newcomers to keep it alive. One has to look much farther into the reasons for that failure, not sugar-coat over a virtual Novice class with some new name and saying that this window dressing will make it work. Very unlikely.

Okay, who is the private sector enterprise that is in direct
competition with the LA DWP? I'm curious since I've not
heard of any private sector competitor of electric power to
the LA DWP since I moved out here.

>>As of today, Friday, the DWP is selling close to 9 GWatts
>
> 9 GW is 9000 MW....equal to NINE units of nuclear power
> plant generation (1 "unit" is 1000 MW). Five plants the size
> of Diablo Canyon. Hard to believe. Where are they hiding them?

Bad note taking during breakfast while listening to TV news
on one subject and carrying on conversation with wife on
another subject. Let me correct my error by a quote from
page B4, LA Times Valley Edition for 19 January 2001:

"On Wednesday, the DWP provided a crucial 300 to 700
megawatts per hour, or 10% to 20% of its output, to the
state power grid as controlled blackouts rolled across
much of California. Meanwhile, the 3.8 million Los
Angeles residents wom the DWP serves had plenty of
money."

Phil, nobody is "hiding" any DWP electric power
generation plants. The one locally called "The Four

Stacks" (visible from the hill above my house) is on aeronautical sectional charts.

Yes, Phil, I made an error in numbers. Mea culpa.

The maximum electrical power generation of the LA DWP is roughly 3500 MWe (if everything is on-line), a personal input from an Electrical Engineer who works for the DWP.

I'm sorry your QTH (or 10-20 or whatever) is being hit with rolling blackouts. Down here in Los Angeles there are no rolling blackouts. Los Angeles DWP also has a praised general manager named S. David Freeman, new to DWP as of three years ago but very experienced in utility management. What is happening is that the LA DWP already has the capacity to help out the rest of the state and is doing so without disturbing its regular customers.

Locally the DWP manager is under political fire because Freeman hasn't charged enough per MWHR according to LA Mayor Richard Riordan. Riordan is worried about $170 million in electric power sales revenue already owed the DWP by the grid's customers. It seems to me that this "little" municipal electric facility is trying to help the rest of the state and is getting dissed rather unfairly by Californians farther north. TS. :-(

The LA DWP has the MWe capacity to serve its customers and still sell power to other power companies.. Other, private electric power suppliers don't have enough capacity. The only conclusion to be drawn there is Bad Management of the private companies. [I'm sure your mileage may vary]

Brings up a piece I read a few years back. Somebody sorted thru ancient Spanish archives related to the history of the earlist Jesuit efforts to do their thing in what is now the LA basin. The locals were of course were quite ambivalent Indians who advised the Jesuits that setting up a mission in that neighbohood was not a very good idea. The Indians knew the game, the topography and wind patterns are such that they never set up camp in the LA basin because the smoke from their campfires simply stayed there and choked 'em. Their name for the LA basin was "The Valley of Smoke", decent fishing but no place to actually live.

Oh,that won't matter at all. He has an ingrained hatred for anyone who
holds an Extra Class ham license. That is, a REAL one that required a
real code test.
I think his Mama was scared by the ghost of Mr. Morse when she was
carrying him.

Entry into ham radio today is for the middle aged to the retired, for
those who "always wanted to but never had the time or extra money, job
and family responsibilities kept me out", etc, etc. Kids have no clue
nor any interest.

In the eight years I worked as a VE we handled almost no kids, nor
anyone under age 30. There were a few females, but very darn few. Most
of the crowd were aged 35 and up, with the oldest at age 80.

My VE time ended over 7 years ago and I don't think it has done
anything but get worse since then. At that time we had no Internet
access in this rural region. The arrival of that passtime pretty well

cinched it.

>Almost everything was HF since VHF and above was the
>Twilight Zone inhabited only by gurus and wizards. :-)

In 1958 in Phoenix we had quite a large VHF club. Maybe 50 members. We had a weekly net on 50.34 Mc. AM. I was using a BC-455 surplus arc5 receiver fed by an International Crystal converter. My transmitter was a Globe Scout 680. The antenna was a 4 element Taco beam with an "armstrong" rotator. Twilight Zone? gurus and wizards? Hardly. I was a Junior in high school at the time. I did work a lot of DX with that setup though as we were coming up on the best sunspot peak in recorded history... :-)

> Want to have a multi-band HF transmitter? Good luck.

My Globe Scout covered 80 thru 6 meters unmodified...

>Anyone who wants to go back to 1958 is nuts!

Well, as I recall the girls were prettier, and the cars and radios were neater. But besides that, heck no I wouldn't go... :-)

That's fine, Darrell. However, I suggest that you read back over the last few months (or years, if you prefer) to see the number of politically related discussions in this newsgroup. In other words, political topics have been part of this newsgroup since its very beginning.

And there are several reasons for this. The main one is that many of the regulars in this newsgroup post here rather than chasing each other around the newsgroups simply because it is easier.

Of course, this should not bother you since you're free not to read anything that does not interest you (nobody forced you to click on my message and read it). In other words, if you see a topic that does not interest you, simply move on to other discussions.

Obviously that is hard to do when you don't agree with the content of the message you're complaining about. And it is especially hard when you cannot think of an effective argument against what is said in that message. So, instead, its easier in this case to fall back on the old "this is a ham radio newsgroup and the message is inappropriate" argument in an effort to hopefully end the discussion before it gets started.

Likewise, no disrespect intended, Darrell.

I don't think he has read the newsgroup at all. Just glancing through the subject headers, at this very moment there are discussions about prisons, the California power crisis, cellphones, gay web sites, top ten most popular alchoholic beverages, and Jesse Jackson. Its not about politics - he just didn't like what I said.

>the novelty wears off, it's over, as quickly as it began.

Then it seems having eGroup's and entire "newsgroups" on so
minimal an asset is pretty wasteful.

However, I do know that there ARE persons (and no small number)
that are using FRS to supplement their 11 meter and scanner activities.

Seems awfully "hobby oriented" to me.

Correct me if I am wrong but isn't that illegal under the FCC rules?
Doesn't it say "regardless of the number of elements taken"? Maybe
you should have a talk with the VEC. Sounds like they owe you a
freebie.

Sec. 97.527 Reimbursement for expenses.

(b) The maximum amount of reimbursement from any one examinee for
any one examination at a particular session regardless of the number
of examination elements taken must not exceed that announced by the
FCC in a Public Notice. (The basis for the maximum fee is $4.00 for
1984, adjusted annually each January 1 thereafter for changes in the
Department of Labor Consumer Price Index.)

Yes you do have something to complain about. It's going to cost you
another $10 to take the Extra exam at the next session when it should
have been included in the last session. Whether you took it when you
upgraded for general or later, they are still going to charge you an
extra $10. I'd show them the FCC regulation (I posted it here in
another reply to you) and ask for a freebie.

Stewart,

The Netherlands implemented a license class very close to what you propose back about 1985 or so. A communicators license intended to bring the Citizens Band under control. About 5 frequencies were set aside in the two meter band for users. A ham license was granted with no code and only a simple theory test, about adequate to determine if the on light was on! People flocked to get in on the simple ham license. The government hoped if they were really interested they would upgrade, and if they weren't they could still take advantage of the thrill of communication and not bother the others. Holland requires evidence of a ham license before you can buy a ham radio,

The result? Almost no upgrades. Those who got into it stayed there. IS that what you want for our kids?

Yes - this is the crux of my point in including the CB group in the
original post. 11 meters is no place for newcomers to be learning.

QRM;

I do understand your concern about the vile nature of CB, and CB posts moving into FRS and the FRS newsgroup. I don't know if you have noticed, but FRS IS becoming a bit more like CB everyday, and, I think we can all agree, CB is obviously not the place for our kids to be learning about radio. The more serious ones need somewhere to go. I have been working on an update to my proposal with significant changes based on the comments I have received(most importantly, I will be using the traditional term "Novice Class" to describe the class), and I will only post it to the r.r.a.p., and a.r.f. newsgroups.

Also, QRM makes a good point about staying on subject. Criticism is good, but let's all of us try to keep things related directly to the subject, and be on our best behaviour(my "Sputnik" diversion, while interesting to some, and which I thought might be relevant, turned out not to be on subject). Most importantly, I would like to ask folks not to reply to CB-like trolls and baits.

Finally, some may ask if I am serious about this... Yes, I am. It is sometimes difficult for me to see my ideas get ripped to shreds before my eyes, but I've gotten better at understanding peoples concerns, and using them to make the proposal better.

Don't be paranoid! I didn't say you were hiding anything.
I didn't say it was wrong to have a business (lot's of people
have ham radio businesses). I just pointed out that I now have
a better insight into the reasons for your nonsensical proposal.
Doesn't make you a bad person.

73, de Hans, K0HB

PS: My old ARRL license manual has questions about capacitors and
inductors in the Novice section, so you weren't "right about the
point".

Brian:

As long as I continue to speak the truth, why shouldn't I have a
loyal following? This is Usenet. A part of the Internet. It is not
Amateur Radio in any way, shape, or form. In this and other
amateur-radio related newsgroups, amateur radio is the major
topic, but still, ham radio it's not. We are not communicating
over-the-air on assigned amateur radio frequencies or operating
under the authority of our FCC-granted amateur radio licenses.
No such license is required to post here. To pick up the mic
of my 2-meter rig, press the PTT button, and say "K3LT
listening," I need a license. To post here, I don't. Get the idea
now, Brian?

fist, and slam it into your mouth at high velocity. Continue to do
so until at least three teeth are completely dislodged.

Here's what I really said:

"In such a situation, an armed response by law-abiding citizens would
definitely be in order to prevent the armed environmentalists, convicted
felons, abortion rights activists, and Ku Klux Klansmen from *actually*
shooting our elected Congressmen and Senators."

>> What causes are you willing to fight and die for, Jim? Are you willing
>> to die for baby killers, tree-huggers, and violent racists?
>
>The guys in the Revolutionary War, and World Wars I and II did. So if I
>was in the military, I guess I would have to also.

Don't look now, Jim, but nobody who ever fought in any U.S. war as
a U.S. serviceperson ever died for baby killers, tree huggers, or
violent racists. They died for the cause of freedom, not what people
do with their freedom. The fact that a certain segment of our
society misuses their freedom to create a sick society doesn't
diminish the sacrifice of those who fought to ensure that our
freedom continued to exist.

>> (I consider myself to be an "environmentalist" also),
>
>I meant to write eco-terrorists. You aren't one of them too, are you?

Nope. I'm not any kind of terrorist. I abhor terrorism. I am, if

>Your mileage may vary.

Ed:

The hams who have the "code-key burying cermony (sic) in their
back yards" are a perfect example of the slack-jawed, drooling,
knuckle-dragging ignorance of trailer-trash hams I've been talking
about in this newsgripe for years! Those who learn the code well
enough to somehow pass the tests, and never make a regular
practice of using CW on-the-air are also very common (in every
sense of the term). Nobody's mileage varies on that.

Being a proficient CW operator, and a regular CW user on-the-air,
defines the higher-level amateur radio operator. WE are
intellectually and morally superior, and have earned the right to
hold our place as the elite among amateur radio society. WE have
earned the right to our privilege and status; those who come
after us are only mere pretenders to our magnificent level of
enlightenment. Now, leave me alone -- I'm enjoying a fresh
silver platter of peeled grapes!

>intellegent and articulate.

Ed:

That doesn't mean she isn't lazy. What is she doing with the code NOW? Is she using CW on-the-air? Is she advancing her proficiency in the mode? Or is she barking into a microphone?

If it took an "intelligent and articulate" YL over a year to pass a 5 WPM code test by the skin of her teeth, with lots of Elmering and advice from experienced hams, my guess is that she never tried using it on-the-air. Has she pumped a single dit through her dipole? I'm willing to bet she hasn't. Learning the code just as a means to an end, i.e. attaining voice privileges, will always be a burden, but that's how it is perceived. Learning the code in order to become a proficient CW operator is no burden at all.

>All it shows is that we are all different. By the rule that some have
>offered that the code test should measure effort, she should be given

>
Yeah, in my area. Last time I lived in a city I was three years old, poof, outta
there. I went to a high school in a township which had around 450,00 citizens
back then, there were 450 +/- of us in the graduating class of '55 which included

6-8 hams. Which school is hard by the City of Philadelphia where the numerous high schools both public and parochial were bigger and they were *all* on the bands.
>

> >The 80 & 40m Novice bands crawled with other kids.
>
> Really? My experience was a lot of WW2 vets were doing

The norm was to swap and log ages as Novices and very few were 30 or over. Most of the bubble of WWII vets who got into ham radio as a result of their wartime experiences already had their ham tickets by '53 when I got on the air, certainly by '58 which was 13 years after WWII ended.

Do that. At least three of the former Novices in my high school class went on to become EEs and two of us went into other engineering disciplines. One of the electron jugglers went on to become a GE VP. No doubt non-hams also became EEs but not out of that class.

Wrong. The Harvey-Wells bandswitched 160m thru 2m inclusive (might have been
80-2m). Plus the Valiant I & II, the Collins 32V series, The WRLs, B&W, many
others.
>

>
> Anyone who wants to go back to 1958 is nuts!

>
Of course, but that's not my point. My point is that in many instances the hams
who came out of the 50s & 60s have very different views and values than do those
who came in during the 80s-90s. Much of the "activity" in rrap is based on those

differences. No biggie.

Amateur Radio is not intended as competition to MURS, FRS, GMRS, CB,
MARS, or any other radio service. And creating a new "Barbie Doll
Radio Service" distinctly segregated from mainstream Amateur Radio
will ultimately be damaging to Amateur Radio.

Aren't you over-simplifying a bit, Brian? You are dealing with public utilities six inches from bankruptcy so you are not all that sure of being paid at all. A lot of these are natural gas turbine plants (a lot of them surplus jet engines on an alternator) and you have seen the price of natural gas lately on the spot market. Under the circumstances no sane supplier would get anything less than top dollar when he may very well have to take 20 cents on the buck five years from now. Orange County welshed on its debt so sovereign California is a crummy risk let alone one of their utilities.

There has been a lot of babble about 'long-term contracts' so maybe someone will learn a bit about the running of a power company. You have to plan for base load (the minimum draw on the system), seasonal loads (like winter or summer), and peak loads (when the coffee pots and electric water heaters come on in the morning) plus planning for intended or unintended maintenance.

For base loads, nothing beats the nuke. Burning coal or oil will actually raise the background radiation more than the equivalent hot rock and has a lot more total environmental damage. Being somewhat more variable, coal plants are ideal for seasonal loads. Union Electric in St. Louis takes advantage of a characteristic of coal plants -- that it takes almost no added fuel to run between about 75 and 90 percent -- to pump water up Taum Sauk mountain at nite and let it run hydro during the day. Peaking is by necessity a low-capital, high running-cost operation at one time served by firing up old plants that were not cost-effective any other time; environmental regs brought this to a grinding halt hence the jet engines.

Obviously, maintenance considerations enter the picture and California complicates the issue with annual pollution maximums. So one interconnects both for emergencies and cost considerations; if the Bureau of Reclamation has some extra hydro available why burn coal? You do have to take down the nuke for fueling and boiler tubes and flues do on occasion have to have the crud removed. One does not put all the eggs in one basket; we leave that to beancounters and politicians.

So this puts some problems in the hands of those designing and operating the connecting grid. When you buy power you in effect have a generation station at the border; when you sell, you have a major load at the border. This gets complicated by Esmerelda Q. Fartblossom bellowing, "No matter what anyone says, transmission lines cause leukemia and besides they are OOOOOOGLY" It is notable that the north-south transfer capabilities of the California grid are severely limited, in effect giving the state two systems.

While micropower installations are probably a good idea, presenting in general only the risk of electrocuting your linemen from an unknown source, such items as windmills and solar with their attendant problem of non-cooperation by the weather present some interesting network design problems as well.

Separating the grid from the generation facilities was basically dumb but handleable if not in the hands of politicians. It just collapsed sooner than later.

It is apparent that neither California system is meeting even its base load locally. Base load plants require tremendous capital which in turn requires a stable planning horizon and some form of guarantee of a return -- the dark side of regulation. As with most utilities, what you are really paying for is the bondholders. As a result, you usually get ossified management.

It is not a job to be run by committee or public hearing although I guess one must maintain the forms and illusion of democracy. In a state which conducts public hearings on the social impact of a new area code, the future does not look bright.

Now go change your diaper, colostomy boy. That's what you have to do on
a hourly basis from what I've heard. Of course, it wouldn't have
happened if your drunken, alcoholic daddy didn't use you as his bitch
for years.

>BOO!

Even though you never have to really dress up for Halloween, it's still
way too early for it.
You're so stupid it's a wonder you can remember to breathe. A half-wit
gave you a piece of his mind, and you held on to it, isn't that true,
PISSFLAP?
Now, why don't you two attack W4NTI, he made a "non-agression" pact
with W4AMP as well?
Or are you just a couple of hypocrites?

What did you e-mail me that you liked to ream with your tongue??
> Asshole.

Yeah, that's what it was.....
Hey, I heard you went to the butcher and asked for 10 cents worth of dog meat and he asked you if you wanted it wrapped or if you would eat it on the spot.

Fuckhead.

No, I meant "dribble" that is what morons start to do when they talk excitedly. Go learn some more.
Opposition? Hardly; go play in the mall with your FRS radios and stop taking up space in this group with your nonsense. Cross posting can go both ways.

Perhaps if you thought them out a bit more. This is/was a WAY
BIG "been there/done that". You reworded it a bit, but it was the same
thing you submitted last year, and it's still just as untenable today.

> but I've gotten better at understanding peoples concerns, and

Keep any proposal simple, mainstream and appropriate. A handful
of segregated channels at UHF is NOT the way to go.

Good point. There's a lot to be said and a lot yet to be learned about
geo-thermal energy. Until very recently I was working on a project in a building
which was originally built as a commercial aircraft hanger. The next building
over is also a hanger converted to industrial use. The owner of that building
had a geo-thermal firm come in and punch twenty-some thermal wells in the front
lawn, install a complete heating/AC system, etc. Lotta bucks to get it running
but the owner expects to get heat & A/C energy savings somewhere in the 75%
range. Struck me as amazing, I had no idea it was possible. This is not SoCal,
our lows go to sub-zeros and the highs can hit over 100F with electricity
somewhere in the 13 cents per kwh. range. That guy is gonna save tens of
thousands of dollars per year, he'll get his investment back very quickly.

I'm absolutely convinced that the Internet is the worst thing that ever hit ham
radio. Beyond that I don't think for one minute that a "solution" is to introduce
Internet-like capabilities into ham radio, they're two entirely different animals
with the only commonality between the two being competition for what people chose
to do with their leisure time.

Enron has been running one in Iowa for years but is limited by Iowa P&Ls
grid. It is on their website.

Look at the companies they got to do the designs of everything from the
propellors to the gearboxes to the towers. Reads like a Who's Who of
engineering couth.

Very well put and accurate. I just heard the former President tell
everyone how much good they had done. And that just because they were
no longer in political power, that was not a reason to stop doing what
they did for the last 8 years. Hmmmmmm, where's Monica?

I am holding out hope that after the American public saw the demoncrats
in action in Florida, they will put an end to this feel good crap once
and for all.

They did if you sent them your input. If you did not, all of your protestations here were a tempest in a teapot.

>I'llhave to sign into the HQ website and check out the current question pool.

Have you really been "protesting" and insulting people without having looked at the pools?

> They would be hard to answer without knowing the material.

I think that the questions I discussed on another thread about meters vs frequency are another good example. I bet the guy was relieved to know he could answer all those questions by memorizing 300/F instead of rote, eh?

There are some questions in the pools that I think are too easily memorized without understanding, but, IMHO, they are a minority.

Amateur radio operators are thinking individuals. (for the most part)
Amateur radio operators think of other things, besides "rig here is".
(for the most part)

I have no problem of discussing things that effect our lives in the
context of a 'radio group'. In fact it gives us the thing that keeps
it all reasonably civil. And whats that you ask? A interest in radio.

Just my opinion, no disrespect intended.

>So without an effective test what assures that a licenesee ever did
>anything at all???

We need an effective test, to determine that the applicant has the qualifications to operate within the rules and to meet the regulatory goals of the Amateur Radio Service. I believe that the testing we have to day does that at least as well as the testing that got me into ham radio.

As to determining what a licencee did, how about we, well, determine what he or she actually did? The accomplishments of hams after they get their licenses form the reasons for the very existance of the Amateur Radio Service. If all hams did was pass Extra tests, of ANY era, there would not be sufficient justification for our use of the spectrum.

He hasn't delegated the authority for the collapse yet :-)

just look at Enron.com and select Enron Wind. Incidentally, they run a
1.6 MW plant at Tehatchapi CA.

Dick

>
>Yes, because that's the way it was. How many daycare centers were there in
>1958?

I can remember at least five in my home town but remembering
daycare centers were not a priority when I left it in 1956. :-)
At least four of those were begun during WW2 when more folks
worked.

>> >There were no home computers. There were ham
>> >stores in every populated area.

>differernce. We have one left which a true rarity.

The HRO in Burbank is about the size of H&H Electronics in
Rockford, IL. "Owner-operated" businesses carrying consumer
items are on the decline all over, a consequence of economics
rather than radio or customer-specific commerce.

A significant difference between 1958 and 1998 is the amount
and variety of ready-built amateur radios and equipment. On
the floor, not 'ordered-from-catalog' items.

>Wrong. The Harvey-Wells bandswitched 160m thru 2m inclusive (might have been
>80-2m). Plus the Valiant I & II, the Collins 32V series, The WRLs, B&W, many
>others.

Harvey-Wells went all the way to 2m in 1958? I thought the
Gonset G76 was sort of SOTA with 6m at the top end. :-)

At Ramo-Wooldridge (the 'RW' that spun off TRW) there was
a young engineer with a KWM-2 in his Triumph sports car
back in 1960. That's rather an exception to the rule, I think. :-)

>> Anyone who wants to go back to 1958 is nuts!
>

do
>those who came in during the 80s-90s. Much of the "activity" in rrap is based
on
>those differences. No biggie.

Each generation has different views and values. :-)

Problems come about when each generation tries to instill its
set of values on other generations...because they "are right."
:-)

Interesting constant here and in ham publications: "We have
to get the young interested!" It's become a mantra.

Invariably that "need" is espoused by those who became
interested when they were young...which may or may not
be part of the "you have to do it they way I did it" school
of ham religion. Why just the "young?"

Grab them when they are young so they can be brain-
washed into "proper values?" Amateur radio is a hobby,
not a political doctrine.

Grab the young because adults have the temerity to talk
back to other adults? Amateur radio is a hobby, not a
military service.

Grab young folks so they can "get started on a career
in ham radio?" Amateur radio is a hobby, not a trade,
guild, union, or profession.

Maybe I'm wrong, but I and all the people I've worked
with in electronics in general found the subject very
interesting, fascinating, even fun...at any age. Why
can't the interest begin at any age group?

My apologies. I've been under the mistaken notion that this
particular newsgroup discussed POLICY in regards to amateur
radio and amateur radio regulations.

If it was concerned with POLICY then I expected some
consideration with the coexistance of amateur radio with
other radio services.

Maybe there will be a scientific breakthrough soon where
there will be separate EM spectra just for the different
radio services...

>

>Guess that's too much to ask from politics, 'specially on the Left
>Coast. No "vested interests" in geothermal as in oil and gas.

Dickie...please try to stay out of areas where you have
insufficient knowledge of the subject. Had you properly
researched the situation of geothermal energy, you would
have found that there is not enough in California to make
it worthwhile. Even "wind farms" of many, many wind
turbines barely make it on competitive energy production.

The "vested interests" in electric power production are
nuclear, fossil-fuel, and hydro plants. The rest are gist for
Discovery magazine, maybe Scientific American, but the
running costs per MWe can't compete with the three
major forms listed.

It would be better served to concentrate your explorative
efforts to innovating something like a pedal-powered
electric generator to go along with the key and CW rig
you said you used to carry around with you at all times.

Old story out here. One thing that happened from the LA basin
experience is some serious consideration about air pollution
from vehicles. That has worked out quite well for the nation, like
it or not. Measured air quality in Los Angeles and surrounding
area is now ranked as moderate and quite comparable to other
US cities not having such geographic anamolies. The old Bob
Hope radio show jokes about smog are just historical items now.

Just to hedge bets, though, my nearly 38-year-old house is
located in the hills of the Verdugos rather above any smog
(840' MSL by topo map). Bad for radio propagation since
everything is Near Vertical Incidence Skywave. :-(

>> All of California's budget surplus just disappeared...got trans-
>> ported to a bunch of overcharging electric power suppliers.
>>
>> Legalized greed is my term for it. :-(
>
>All they had to do was not go for the quick buck and think ahead, they did

Heh, it's already started. Item in Saturday's LA Times says the
"PX" or Power Exchange in Pasadena, CA, (place for trading
electric power, kind of a junior stock exchange) is now laying
off staff, expected to close down. Electric power trading now has
to revert to old system of power companies calling other power
companies like they did in the "old" days. :-)

It's not always easy living in a "test bed" area...

The information you had access to may have been stale, and never was
entirely accurate.
The class-D license did in fact give you 6 channels. You had to upgrade
within two years. THe upgrade requirement was later dropped.
After a short while the examination level was graded up quite considerably.
The license class was changed accordingly and now gives you a CW subband, an
SSB subband and an FM subband on 2 meters and on 70 centimeters.
The D-callsigns were assigned alphabetically, starting with pd0aab, then
aac, aad etc.
If you look in the callbook, you will notice that there are not many left
over. Many of the "old" names are now found under the A or C class entries
nowl
To recap: Dutch A-class is "everything" (hf, vhf and up, all modes) and
requires morse code and electronics theory. C-class is VHF and up, all
modes, requires same theory but no morse code. N-class replaces D-class (N
for Novice) and requires limited theory, gives acces to Novice subbands on
2m and 70cm.
No-code on HF has never existed in Holland, but we all know the rumours..
just have to see what happens now.

have a good one,

> > So why would anyone fight that?

> Four pages vs sixteen pages vs over 200 pages. Which are you calling
> "extremely simple" again?

Again, since you only seem to have focused on the sound bite and not what I wrote; "The Novice ticket [1973] was extremely easy if you has [had] someone to to work with on it."

I certainly wasn't talking about Q&A Publications at all, or even the recent license restructuring at all (that I feel will have have far less impact than that of the loss of the Elmer-Novice entry to the no-code tech entry years ago). And don't think I didn't notice you changing the subject in order to plug your publications, but I am an ARRL supporter (on a great many issues) and long time member. Let's for a moment ignore the absolute number of pages because there is certainly more to a publication than the number of pages. In 1973, I found the License Manuals completely inadequate for study of the concepts that the radio amateur really needs to know in order to understand what he is doing, and how to get the most out of his station, and to do it without interfering with the neighbors. I turned to the 67, 68, and 69 editions of The Radio Amateurs Handbook in my study, long before taking the Novice exam and continuing to learn about amateur radio operations by doing, by making mistakes and by polishing my craft under the guidance and on the shoulders of those who went before.

Not by taking a packaged course that promises that I will be a ham when I take a test at the end of the seminar (as some VE's out here are promising). There is so much about Ham Radio that can't be taught in a publication or seminar because it is way too impersonal and doesn't give enough hands-on like the Novice License did.

Let me explain another way: The Novice License was an easy way to get on the air and get a taste of Amateur Radio, and provided a proving ground fertile with learning experiences with time to progress. The current entry situation caters to instant gratification and bestows priveleges not yet earned by experience.

> I agree; the lack of Elmering cost us a lot of hams. So did
an "Elmering"
> process by which some hams made newcomers feel like they were seen as
having
> come from "skid row..." I don't know which had the larger effect.

Perhaps the greatest effect has been from establishing "Skid Row" as an entry level training ground in 1959, that many find difficult to "unlearn" when moving forward.

Jim, ac6tk
PS, I just had someone explain to me this morning that reverb improves "talk-power". I'm sorry, but I couldn't help laughing.

The Energy Calamity is quite localized and not likely to hurt your 401k
but is being portrayed as an indication of "the need" for further
government control. The state has so many "partners" and restrictions
on the private sector already, it's hard for business to compete with
them. A great many business operations have moved away over the years
because of this. I suppose now that the census and re-apportionment is
over with, we can now all leave.

During the current stage III alert, many businesses and schools have to
drastically reduce or shut down electricity because of the rate plan
that extorts extreme penalties and fines for exceeding set stage III
limits. Even though the blackouts are being imposed up north,
businesses and schools all over the state have been closing or
operating in the dark because of the stage III restrictions.

The real calamity is that this was allowed to happen at all in a
(supposed)civilized society.

Jim, ac6tk
PS "over-robust"... is that something like excessively-winning? Why
did we have to beat down Microsoft?

California has considerable windpowered electric generating capacity already, tho I don't know its efficiency level. Altamont Pass on I-580 about 30 miles east of San Francisco is almost surreal, you cruise over the mountains surrounded by hundreds of large modern windmills, of several designs including Savounis(sp?) Rotor ("eggbeater") style, all churning away, dumping their output into the power grid. There's another similarly sized field on State Rt 58 at Tehachapie Pass east of Bakersfield, well to the south. These locations are places where the wind almost never stops. I don't know much about the capacities of these generators nor much else about them (and would be interested) but they appear to be sizeable. I'm told that all are privately owned by investors who sell the output to power distributors, who are mandated under law to buy it.
Evidently these have long been absorbed into the consumption scheme and many of the windmills have been in place for a long time, and each time I go out that way I see what appears to be newly installed units.

OK, rather than a bunch of old geezers sitting around casting cold water on Stewarts idea, let's look at it from the view of the intended market.

Dick and Jane, 14 years old, have "had it" with the limitations of the FRS and now are "interested in experimenting with radios". They've heard of something called "ham radio" and are investigating the entry classes.

Jane says "Here's something called the Technician class. You have to take a simple 35-question test."

Dick says "Here's something called the Colt class. You have to take a simple 25-question test from the same pool."

Dick and Jane decide to investigate further, to see what difference the 10 additional simple questions make.

Dick says "Colt gives you six simplex voice/digital channels on 446, and another six simplex voice/digital channels on 223MHz. You can even build a simple little repeater between them, as long as input and output are not on the same band."

Jane says "Technician gives you 22,243 Megahertz of spectrum on 16 bands between 50MHz and 250GHz. Holy Cow, Dick, that's millions and millions of frequencies instead of just 12."

Dick says "With a Colt license you can transmit 5 watts of power. That's a lot better than FRS!"

Jane says "5 watts is for sissies. With Technician we can transmit 1,500 watts of power!"

Dick says "Yes, but the Colt radios are cheap."

Jane says "Sure, but there are lots and lots of used radios around for Technicians, even cheaper, and your Colt radio will be basicly useless if you upgrade."

Dick says "Hey, but I could put my Colt antenna 20 feet above the house if I want."

Jane says "Big deal, Technicians have no arbitrary height limit like that; they can go as high as zoning laws allow, and even higher with conditional use permits."

Dick says "The Colt license will be a lot of other kids just like me."

Jane says "I thought we were sick of kid stuff, and wanted to experiment. The Technician license lets us talk to kids and doctors and lawyers and indian chiefs and satelites and astronauts and W1RFI even."

Dick says "Colts can use both voice and digital modes."

Jane says "Hey, with only 10 more simple questions the Technicians are allowed all of that, and other neat stuff like SSTV, FSTV, telecommand, and space communications."

Dick says "Jane, you are right. This Colt thing is really lame. I always said you were smarter than me. I could just kiss you."

Jane says "Dick, only after you pass your Technician License test, and keep your clammy paws off my double bazooka antenna."

OK, rather than a bunch of old geezers sitting around casting
cold water on Stewarts idea, let's look at it from the view
of the intended market.

Dick and Jane, 14 years old, have "had it" with the
limitations of the FRS and now are "interested in experimenting
with radios". They've heard of something called "ham radio"
and are investigating the entry classes.

Jane says "Here's something called the Technician class. You
have to take a simple 35-question test."

Dick says "Here's something called the Colt class. You have
to take a simple 25-question test from the same pool."

Dick and Jane decide to investigate further, to see what
difference the 10 additional simple questions make.

Dick says "Colt gives you six simplex voice/digital channels

The need for all of this will go away once my group leaps into action. When we have eliminated all the "elitism" on the bands and issue every citizen an Extra class license, as is their God given right, all will be right with the world.

No Code!
No Test!
No Hassle!

All that water flowing from the Delta down to Los Angles in the
California Aquaduct always seemed to be wasted energy since enroute it
could easily be generating electricity several times over. I know of one
reservoir enroute where water storage is shared with power generation.
Then down south of Bakersfield where the Valley runs into the mountains
it all has to be pumped, using a LOT of electricity of course, across
those mountains on the last leg of the journey to LA. California has
done apretty good job of taking care of its water needs, but seems to
have sorta overlooked a stable supply for its longterm electrical
requirements.
We know that hyodrelectric generation is but a drop in the bucket.
Even back in these parts where there are several largelakes with
generating dams on the White River System, it only makes up around 5% of
the total used. But I'd imagine that same 5% could be very helpful to
northern Cal right now.
And there *are* significant if undeveloped geothermal resources in
several places in the Golden State. One is the area around Bishop and
the east slope of the Sierras. It matters not if they're far from metro
areas. What ie needs is development. In the Upper Napa Valley there is a
fair sized geothermal generating plant online now. Point is, even these
lesser installations help a lot in a squeeze, just as you mentioned with
Taum Sauk Reservoir. They can use it for peaking whenever needed. Mostly
hydroelectric power in these parts *IS* used for peaking.
Did you ever drive up and take a close look at Taum Sauk lake on top
of one of Missouri's two highest peaks, that you mentioned? It's a very
impressive 40 acre lake with the supply/drain tubing carved out from
inside the red ganite stone that is the mountain. The water falls 980
feet to the turbines, and gets pumped back up that far overnight. UE
gets a lot of efficiency and a very good return out of that investment.
And what a engineering and construction project!

>
> Separating the grid from the generation facilities was basically dumb but

>

I have little faith in elected officialdom in the Golden State. I spend at least a month each year out there, and have for a couple decades, from south of San Diego to the Amtrak exit at the northern border. The state has a lot of attactive attributes, but these do not number in selected important elected officials' reasoning power and common sense. Political Correctness and assuring their reelection is far more important than needed hardware or realistic planning.

> It is apparent that neither California system is meeting even its base

I think this statement proves my last. The most important part of their future utility supply planning seemsto have been to get the rates down so as to maximize their political capital, and let the distant future be taken care of by whomever was unfortunate enough to be in office at that time. What they failed to realize was that the future was coming a lot sooner than they thought.

> It is not a job to be run by committee or public hearing although I guess

As long as they maintain the same political direction they've followed for the past 20 years they're doomed. Something's gotta give.

The worrysome feature of California is that it always seemed to be about 20 years ahead of the rest of the country in most areas of modern life. That has at times seemed a bit scary. Today's crisis just emphasizes that feeling. You wonder who else is sitting that close to the edge.

Dick

Repeatedly you assert that the test is pretty much worthlessand most
unnecessary. So then why even have one? Or is that down the Agenda a
ways?

The Harvey-Wells Bandmaster, 50 watts (807?), CW & AM, fairly compact, stood on what would usually be the end of it's cabinet. About twice as high as wide, sucked up very little desk space. Went to both 6m and 2m in addition to HF. I think it listed for $249.95 in the early 50s. The big sloping panel linear scale VFO slipped under the cabinet and was another 50 bucks or so. Died from overdoses of TVI and ssb.

Bah. I have absolutely no idea why this "we gotta get kids into the hobby or ham radio is gonna die!" thing is so pervasive. Makes no sense at all to me.
>
The youth factor associated with the 1951 Novice license happened under much different conditions in much different days and I doubt anything like it will ever be repeated. It's of some historical interest, it obviously left a big footprint, there were a helluva lot of kids but for the biggest part the history is the sum total value of it today.
>
Ham radio is a great hobby for all ages but particulary for the eldercrowd. They have the time, they have the money and they have attention spans longer than this

morning. We have several housebound hams around here whose only opportunity to socialize on a meanigful basis is via the airwaves. Providing them with that ability is 'way above most of the rest of the "items on the list" used to justifiy the existence of ham spectrum space as far as I'm concerned.
>
The kids need to be shown ham radio and supported if they do express an interest ditto any others of any age. A mindless thrash to twist ham radio into something it is not, has never been and never will be just to "attract kids" is nonsense preordained to go nowhere.

If I were getting into a new hobby that involved a community, as does ham radio, and was given the impression that I "better" be a fairly fast learner, or I would receive a public lashing for what I felt was an innocent choice of words, I would very quickly decide that is not a caring, sharing community. I almost certainly would find a different circle, because with friends like that, I would not need enemies.

Fortunately, when I first became a ham and probably made "gaffs" that I wasn't even aware of, I didn't receive the type of "welcome" you are describing.

IMHO, telling people what they "better" do is not in the spirit of ham radio that I have respected for decades.

I have never said that, Dick. Did you really understand that from my words, or does it suit your Agenda somehow to try to convince people that that is what I "really" mean?

To clarify it again, although I am pretty sure you won't remember this any longer than you will remember it the last time I said it, I believe that the testing of today tests the ability of the applicant to function within ham radio at least as well as did the tests of the days when I entered ham radio.

>So then why even have one?

I disagree with you; I feel it is important that ham radio have testing that tests the ability of the applcant to function within the rules of ham radio.

>Or is that down the Agenda a ways?

Not by me. I feel it is important that ham radio that test the ability of hte applicant to function within the rules of ham radio.

>Again, since you only seem to have focused on the sound bite and not
>what I wrote; "The Novice ticket [1973] was extremely easy if you has
>[had] someone to to work with on it."

I found the 1963 Novice simple enough that I don't recall that I had to ask W1BNB anything about it. I posted the 1963 study guide for the Novice; compare its scope to the exams of today. If you are saying that the 1963 Novice exam is very simple compared to the Technician exam today, then we are in complete agreement.

>And don't think I didn't notice you
>changing the subject in order to plug your publications,

I don't think that ARRL is going to sell many 1963 study guides. My intent was not to "plug" ARRL's pubs, but to use one as an example of why I do not think the exams of today are simpler than they were in the era where I was first licensed.

> but I am an ARRL supporter (on a great many issues) and long time member.

I, too, am an ARRL supporter, although I have not agreed with ARRL on every issue nor do I think it is doing as good a job as can be done in every single thing it can do. I have been a member since about 1986, when I joined the staff.

>Let's for a moment ignore the absolute number of pages because there is
>certainly more to a publication than the number of pages.

I would agree if we were comparing even 50 pages to 200 -- 50 good pages can communicate more than 200 poor ones. But 4 pages for the Novice study guide vs 200+ pages for the Tech study guides is a lot to ignore.

>In 1973, I found the License Manuals completely inadequate for study of the
>concepts that the radio amateur really needs to know in order to
>understand what he is doing,

Absolutely correct. But they were adequate for the study of the concepts needed to pass the tests.

> and how to get the most out of his station, and to do it without
> interfering with the neighbors.

Then, as now, there clearly was a lot to learn after passing the tests and being given the priveleges -- a lifetime of learning for me, anyway. If all there was to ham radio was the test I took, either that test would have taken a lifetime to complete, or ham radio would not be of any interest to me.

>I turned
>to the 67, 68, and 69 editions of The Radio Amateurs Handbook in my
>study, long before taking the Novice exam and continuing to learn about
>amateur radio operations by doing, by making mistakes and by polishing
>my craft under the guidance and on the shoulders of those who went
>before.

I studied ONLY the 4-page study guide for the Novice and several months later, those 16 pages for the General. I bought a Handbook and Antenna Book later, and learned a whole lot more, including why some of those answers were correct. I think it was years later, in my TV repair days, that I finally figured out what a parasitic oscillation was and why it could cause RFI. :-)

>There is so much about Ham Radio that can't be taught in a
>publication or seminar ...

or by taking a test; it is only by doing, over an entire lifetime, that we discover our own personal potential in ham radio. I was a late bloomer. :-)

>because it is way too impersonal and doesn't
>give enough hands-on like the Novice License did.

What hands-on? I read 4 pages and took a test -- I was a Novice. The hands on started with the Novice license for me, but continues to this day. I am still learning.

>Let me explain another way: The Novice License was an easy way to get
>on the air and get a taste of Amateur Radio, and provided a proving
>ground fertile with learning experiences with time to progress.

>The current entry situation caters to instant gratification and bestows
>priveleges not yet earned by experience.

More instant gratification than I got by reading 4 pages of study guide? Although I had lots of Novice experience before I took my General to get all amateur priveleges, the rules did not require it. I could have studied 16 pages of study guide and passed the tests.

Both for social reasons, Brian, and for the simple reason that the generation of hams who entered ham radio by that route does not seem to want tests to be made that simple again. :-)

The FCC is also not inclined to create a one-year, non-renewable license again, either.

>It's of some historical interest, it obviously left a big footprint,
>there were a helluva lot of kids but for the biggest part the history is the
>sum total value of it today.

There are now more modes commonly available to hams, more stable and reliable technology, more frequencies easily used -- the license had to change.

Too bad; that simple 20-question exam for the Novice brought a lot of people into it. What surprises me is that even with the entry-level being at least an order of magnitude more difficult and more complex, growth continued. I don't think I would be a ham today if someone had handed me a 200+ page study guide and told me that this is what I had to know to be a beginner in ham radio. And if they then told me that it was "dumbed down" from that 4-page book THEY had to read...

For God's sake Ed, you are working so hard to be politically correct. I guess if a kid is learning baseball, you should not point out he is running the bases in the wrong direction for fear he will give up baseball?

Give me a single reason we should be bending over and kissing some snot nosed kids ass to get him active in ham radio! If they are interested, I will bust my butt to help them.

I have Elmered more than a few in my time, but at no point did I waste time on anyone who had no interest.

I had one guy wanted to be a ham and was having trouble with the code. It took me a while to realize his problem was not the code, he did not know how to read or write. I worked with him for over a year and he earned his ticket. I remember him struggling to read to become a ham, then I listen to all the cock and bull about "how tough it is on the children to get a ticket".

Give me a break!

1.6 MW? That takes about 3000 HP to generate....any
respectable freight locomotive prime mover can do that.

(That's Tehachapi, BTW).

There has been a "windmill farm" in Altamont Pass, 45 miles
east of San Francisco, for over 25 years. As long as the state
PUC mandated that the PG&E had to buy its power at retail
rates, it worked. When the state subsidy ended, PG&E said
"thanks but no thanks".

I wonder whether the windmills were spinning this week.

No biggie, providing one has the specific software, receiver
with properly-modified AGC and wideband output and a late model
PC and VCR. The technique was developed by a ham at Boeing who
sold/gave it to the FCC in the early 1990s and AFAIK the program
is available "on the market".

Whether one has the necessary training and qualifications
to interpret the results in a manner to be accepted as expert
testimony is another matter.

Call the FCC Consumer Assistance Center (1-888-225-5322) and
request that they send/FAX you a copy of the FCC Public Notice
issued a few months ago warning that the use of these devices is
unlawful. If that does not persuade the school management to
cease and desist, call the same number and lodge a complaint,
which will be investigated. This has a much higher priority
than kerchunking on two meters.

And thus you shed all the Clint DeSoto notion of a fellowship of hams
who share a mutual respect, which was the thread that K0HB was trying to
promote, except without the fellowship and mutual respect. I think it
had something about learning the code, which apparently is far more
important than learning fellowship and mutual respect.

At this point I think its probably OK to tell you to join the KMA club
and ask you to retell your "Favorite Black on the Bus" story, since
we're not ditty boppin or QSLing.

Your objection will only cause people who enjoy getting goats to
just try even harder to get yours. Why not just use your newsreader
kill file feature like I do? There is no way you or I can stop
others from crossposting.

Dick has this delusion firmly set in his concrete brain. "Anyone who
is happy about lowering the Morse code requirement to 5wpm also wants
to eliminate all testing." There's no way to fight a delusion, Ed.

On 20 Jan 2001 22:14:35 GMT, Dick Carroll wrote:

>> While micropower installations are probably a good idea, presenting in
>> general only the risk of electrocuting your linemen from an unknown
>> source,

Not if the system is properly designed, with lock-outs and
safety precautions taken. A while back I watched a transformer
switch-out and was heartened to see the crew hot-stick a line
that they themselves cut out and grounded. The electrician
installing a tap for a second subscriber on the premises entry
lugs (the reason for the switch-out) went in and probed the
meter-board even though he watched the transformer being hauled
down from the pole and the secondary leads were clearly waving
in the breeze.

Take no chances, or as the ARRL pubs say "Switch to Safety".

When my wife worked at the Dow Chemical plant in Pittsburg,
CA she was horrified to see the cogeneration primary and the
utility primary cross on the same pole....a disaster waiting to
happen (and it did, with attendant fireworks).

As I said, "properly designed"....

> All that water flowing from the Delta down to Los Angles in the
>California Aquaduct always seemed to be wasted energy since enroute it
>could easily be generating electricity several times over. I know of one
>reservoir enroute where water storage is shared with power generation.

The California Aqueduct originates in the Oroville Dam (on the
Feather River) where PG&E generates the hydro. There are
several small hydro plants above there on the Feather River.
Which one are you referring to?

>Then down south of Bakersfield where the Valley runs into the mountains
>it all has to be pumped, using a LOT of electricity of course, across
>those mountains on the last leg of the journey to LA.

IIRC most of the "hops" on the California Aqueduct are siphons,
where the function of the pumps is to start the siphon action.
My recollectuion is that the entire system is balanced to the
point that even including the electricity necessary for the
pumps, there is an excess of juice which is sold to the utilities.

>California has
>done apretty good job of taking care of its water needs, but seems to

>have sorta overlooked a stable supply for its longterm electrical
>requirements.

"Vote Yes on Water" - 1960 Prop. A - built that project.

>In the Upper Napa Valley there is a fair sized geothermal generating
>plant online now.

The Geysers is a very old plant that PG&E sold off because it was
no longer cost-effective.

> I have little faith in elected officialdom in the Golden State. I spend
>at least a month each year out there, and have for a couple decades,
>from south of San Diego to the Amtrak exit at the northern border.

The last Amtrak stop before Oregon is Redding, which is quite
a distance from the border. Do you take Amtrak? I make the
rail trip between Portland and Oakland/San Francisco at least
once a year, more if I can get someone else to foot the bill.

>The worrysome feature of California is that it always seemed to be
>about 20 years ahead of the rest of the country in most areas of modern
>life.

That's why I moved to California directly I graduated from
engineering school (where my major was electrical power
generation and transmission) almost 45 years ago.

>That has at times seemed a bit scary.

That's why we moved to Oregon in 1999 - Oregon is what
the good in California was 40 years ago, and alas is no longer.

Well Ed, KN7ENT was the first call I ever used on the air (in 1957).
I chose it because it was not yet found in the callbook, and because
my best friends name was KENT... :-)

>Does saying "personal" instead of "name" or "handle" really need to be a
>"social error" in the amateur community?

No it doesn't. In fact "personal" may become acceptable ham jargon in
a few years. "Handle" which was once acceptable is starting not to be.
Who knows why or how these social rules come about, but they are a
fact of life. And those who insist on breaking them, either on purpose
or in ignorance, should not be surprised if they are treated
differently...

I recently moved to a large retirement community with thousands of
people. When out walking just about everybody here greets you as you
pass. But if I were to go just a few miles outside this retirement
community to the nearest mall, and started saying hello to everyone I
pass, they would likely be calling the cops on me for being a weirdo.
Even making unwanted eye contact while driving on the freeway can
cause you problems these days. Social rules don't make always make
sense, but if you don't know them and/or don't follow them, expect
some difficulty in life...

Last week I noticed a tag on a electric utility truck that said
"If if isn't grounded it isn't dead". Good plan. HV can be insidious. We
had a rural firefighting crew that got tangled up with a downed HT line
that had fallen across a fence last year. Killed one and badly injured
another. Real Bumnmer.

> several small hydro plants above there on the Feather River.
> Which one are you referring to?

The one at San Luis Reservoir, near Los Banos. A hydro plant is located
there, as evidenced by the transmission facilities located there. I
wasn't familar with the one at Oroville dam. When I have asked where the
aqueduct originated the answer I always got was "The Delta".
Hydro is a small percentage of the total generated, of course. Here
where there is a series of hydro dams on the White river it amounts to
only 5 percent of the total. And here it's mostly used for peaking.

All very interesting and again shows that things aren't always what
they seem.
I had noticed all that water moving south and, being from hydroelectric
country, had thought that a lot of generating capacity appeared to be
going unused. That made sense, given the cheap easy availability of
power until recent times. And the big pump station and huge tubes headed
up into the mountains south of Bakersfield sure look like power hogs. I
wasn't aware that siphoning was an option.

> The Geysers is a very old plant that PG&E sold off because it was
> no longer cost-effective.

We've visited the Calistoga Geyser, and I recently read a real short
blurb in some news mag that caught my eye about a new geothermal
generating facility coming online in that area of the upper Napa valley.
It didn't give details. Looks like the increasing cost of fossil fuel
may renew interest in developing geothermal sources, maybe on the east
slope of the Sierras around Bishop? They seem to have lots of it in that
area, if it doesn't blow first.

> The last Amtrak stop before Oregon is Redding, which is quite

> rail trip between Portland and Oakland/San Francisco at least
> once a year, more if I can get someone else to foot the bill.

We made the Coast Starlight run from the SF area to Seattle a few
times when daughter and her family lived up there. Quite a scenic trip
through the Cascades, and Mount Shasta is visible for over 50 miles.
Really enjoyable.
Alas, the kids relocated to the Salt Lake City area.

> >The worrysome feature of California is that it always seemed to be
> >about 20 years ahead of the rest of the country in most areas of modern
> >life.

> That's why I moved to California directly I graduated from
> engineering school (where my major was electrical power
> generation and transmission) almost 45 years ago.

Once that was an attraction. Today, no. Seems that it peaked.
We were in the Bay area for a week in late November. Flew into Oakland
and drove out to Livermore. Traffic is unrelenting regardless of the
time of day or night, and you don't drive away from it when you leave
the city as you once did. It's everywhere, and it has steadily worsened
over the 20 years we've been visiting there. We took BART back into the
city for that side trip and left the rental car parked.
We didn't get out to Altamont Pass this trip, but in June when we were
there the wind-gen-mills were going full tilt. I hadn't heard that PG&E
was no longer buying their output. Evidently someone is.

Once we toyed with the idea of resettling somewhere in California in
retirement, but have abandoned the idea. It appears the best of it is
history. And if they don't get that power situation resolved the
unpleasant future is now.

> >That has at times seemed a bit scary.
>

Cecil, you know as well as I, that any remark that anyone ever heard on a repeater gets expanded to suit the argument at hand. I have in the past condemned "radio cops". Not all polite corrections are critical to someone's ego, at least not to the point that a trip to the nearest shrink is needed.

Some here, on the other hand, feel that the slightest remark is an attack on the self esteem of the poor darling.

We have seen this same nonsense carried to the point if you paddle a kids butt, it is now child abuse.

You tripped a trigger on a project I am about half-surprised hasn't
resurfaced lately. Back in the Nasser days the idea was to siphon water
out of the Med thru the coastal mountains and flood the Qatar Depression
in Western Egypt which is below sea level, recovering electric power on
the drop, creating a second Dead Sea for the mining potential, and raising
the humidity level in general behind the mountains.

May have been totally ridiculous (Gamel was good for the weird) but it
sure wasn't because it would flood valuable real estate.

But baseball has rules, Fred. And nobody is advocating that anyone ignore the rules relating to ham radio. Instead, what we're talking about is simple, somewhat pompus, traditions (unlike "those" other people, "we" don't say "handle" in ham radio).

And, to me, it seems a little silly to make that big of an issue out of something as simple as this. If a tradition is that worth-while, it will survive on its own with only minimal encouragement. If it isn't, then we probably shouldn't be making an issue out of it at all.

And I certainly hope you're not judging the interest of others based on whether they use the same words and phrases you do. If so, then I have a problem because I don't know what you use when talking on the radio (these things seem to vary around the country). Can you send me a list of acceptable, and banned, words and phrases?

What the heck difference does it make if a new ham or an old ham says
10-4 over a repeater? When someone asks me, "QSL?", I sometimes say
"10-4 Gud Buddy" with the proper quiver in my voice just for a laugh.
People who ask, "QSL?", over voice personally drive me up the wall
but this is a hobby, not the U. S. Marines. Why can't we have Elmers
instead of Radio Cops and Drill Sergeants?

I have seen you take a hammer to people you don't even know, Dick; how do you know that all those hordes of people memorizing tests containing questions you have never looked at have skulls of granite?

>ANd you have no idea what kind of a ham I am based on what happens here.

Sure we do, Dick. You have described many of your on-the-air and VE escapades here, and, frankly, some of them appeared to me to have been pretty mean spirited. Do you really reserve such conduct ONLY for what happens here? Why would you feel that you don't feel to be appropriate on the air or in your in-person social dealings with hams is appropriate here? For most of the people here, what happens here is the only basis on which they can interpret and judge the worth of what you are saying.

1246. Dumb guys cancel other people's posts

Newsgroup: rec.radio.amateur.policy
Date: 2001-01-21 13:34:43 UTC
From: kking@no-mail.com
Message-ID: <94eohjpjp0@dosa.alt.net>
Source record: 1494
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.policy

Attempting to cancel someone else's post is really, really dumb because:

1. 80% of the news servers now ignore cancel messages, due to past abuse;

2. Automated software run by usenet admins flags such cancel messages as "suspicious" because critical header elements don't match. Suspicious messages are published in a summary which is available to everyone;

3. 99% of ISPs regard rogue cancels as a violation of their terms of service and will terminate the account of anyone caught issuing such cancel messages.

So, if you only catch around 20% of the news servers, trigger software which records your cancels in such a way that you can be traced by your ISP, and if your ISP is among the 99% who will terminate your account for such activity, who is the dumb guy?

>guess if a kid is learning baseball, you should not point out he is running
>the bases in the wrong direction for fear he will give up baseball?

>Give me a single reason we should be bending over and kissing some snot
>nosed kids ass ...

Is that the technique we can expect you to you when you "point out" that the young sportsman is doing something wrong? Would you at least do it privately, or would you think it best for "baseball" if you said that to him or her in front of the entire team.

Would you equally feel the need to correct him if his field "patter" used different words that the usual "swing, batter can't hit" or whatever words are in vogue with kids that decade? Isn't that a bit different than running the bases backwards? Now, if the ham had been using FM in the CW-only part of the band instead of choosing a synonym for name that you found offensive, perhaps more immediate action would have been in everyone's best interest.

Sorry, I will take "politically correct" over your verison of "building character." When I was a little boy, my mother never called it "policital correctness;" she called it "politeness," "manners" or "respect."

>If they are interested, I will bust my butt to help them.

Do you think the ham who studied almost 400 questions to get a license was "interested?" I sure hope that your help won't contain the words "snot nosed" or "kiss ass" over a petty "gaff" like "personal" instead of "name."

Frankly, I disagree with your assessment that not berating the new ham publically is bending over or kissing ass.

>then I listen to all the cock and bull about "how tough it is on the
>children to get a ticket".

Let's do a deja news search on the phrase you quoted. Care to guess what the one hit will be?

I don't think that the fellow who would use the terms "snot-nosed kid" and "kiss my ass" in a post about it would be "gentle."

>And if he broke down bawling like a girl

Only girls should cry?

> because of it you'd set him on the bench at least
>until his tears dried.

If my public, verbal abuse of a child set that child to tears, I think I would feel that I should do more than set him on a bench until he recovered from the public humiliation I had subjected him to.

Besides, the more likely effect is that the kid would give up baseball forever. Some coaches would feel it was worth the price.

Bullies invariably do their bullying in public, Ed, so as to strike
fear in the hearts of the multitude. Such people often put themselves
in a position of power over little kids because they are devoid of
power and respect among adults.

>From: Brian Kelly kelly@dvol.com

>> The ultrawideband folks are saying... naw, never mind. :-)\

>TRY me!

The short of it is that UWB technology uses very short pulses that have a resultant "baseband" bandwidth of several GHz. The frequency range is in the 1-10 GHz area.

Some of the tutorial and article statements I have seen imply that UWB cannot be detected by radio receivers. True enough if the source is far away, but not so if the source is close. Depending on its modulation characteristics, UWB can produce discrete modulation sidebands or can sound noiselike.

See http://www.uwb.org/aboutuwb.html

for links to more information.

It goes back to the K3LT idea that even though we are (almost) all hams here, the idea of amateur brotherhood and fellowship can only be invoked with a cw key. Hans embraced it; Dick lives it.

Ed, I heard that. Now that my Dick mask is off, perhaps I won't be so offensive and petty.

Here's to rational discussion!

Getting back to JLE and testing, I don't see why limiting the number of times you can take an exam would be a problem. Does retaking an element quarterly sound OK? Is annualy too long?

Also, Fred was advocating showing a log of contacts prior to upgrading. Although a log isn't required to be kept anymore, it really does fall back on good amateur practice (oops there's that silly idea again). Or merely have a year TIG?

I totally agree. Don't take the negative feedback here as what the
general ham population, or the FCC really wants. Remember - most of
these folks were against lowering the CW requirements. They are still
in the "block all change' mode.

We'll find out damned quick, this debacle has gotten the attention of the whole country. Over here on the Right Coast the "I toldja so!" opponents of deregulation are up the butts of the whole contorted structure for answers by the numbers. "Thanks for the wakeup call California!"
>
Interesting observation about one big difference between how they play the game here and how it's played in CA: NJ and PA are two of the few states which did not force the estabablished utilities to shed their generating facilities. Forthwith they took advantage of the opportunity to divest their loser plants and kept the moneymakers. The loser plants appear to be making money now under their new management which was not possible when they were managed by their fossilized previous owners. I'm not sure if I'm still involuntarily subsidizing the Three Mile Island facility or not.
>
The PA Public Utilities Commission has come roaring out of the woodwork and is defensively bleating "Our new regime saved PA consumers 2 billion plus $$ last year, you lucky citizens! We done good, the temps are in the 20s & 30s and the lights are still on!" Thirteen cents per Kwh here or whatever it is the lights damned well better still be on.

For one obvious reason: There are no drop-dead regulatory incentives to upgrade knowledge and skills by getting on the air. So if ya don't wanna bother taking the apprentceship to get to be jouneyman you gotta take a jouneyman's-level exam to get the privs. I don't see anything wrong with that.
>

> The FCC is also not inclined to create a one-year, non-renewable license again,
> either.

>
Of course. I expect you'll agree that the FCC of those days was not the lame and disconnected FCC of today. In retrospect I suspect that what the old FCC actually bestowed on us amounted to a free pass onto the Novice bands for the "cost" of copying 5wpm plus passing the little ceremonial Novice writtens to get us into the game. That was carrot. So of course we all jumped in and got hooked. Then came the stick. Somehow I can visualize FCC thinking going something like "OK you little twits, we hooked you per our intentions, but if ya wanna stay on the bands you got 365 days to demonstrate to us that you took advantage of the opportunity we handed you on a silver platter to learn, upgrade or die". Typical thinking of those days. Today it's all carrots, sticks have become politically incorrect.

I think what happened was that when the repeaters got on the air and 2m became heavily populated the Tech license became a lot more attractive than a Novice

license for the same 5wpm code test. A complete reversal from the situation in the 50s when the there was very little VHF activity vs. the HF Novice bands.
>
Too bad; that simple 20-question exam for the Novice brought a lot of people

Ham radio became a lot more attractive between 1960 and, say 1980. VHF opened up via repeaters and inexpensive solid-state xcvrs, folk in general became a lot more technology-oriented, all hobby activities expanded, lotta forces which are still out there today. Unfortunately it looks like desktop computing is now eating into our market for the attention of the kinds of folk who became hams in earlier times.

Actually it isn't much if any worse than the rest of that generation of far-end boat anchors plus it only runs 50w vs. the Valiant I and some of the WRLs which ran 200-300w. All of 'em tore up the neighborhoods. I'd test the electrolytics, hang a good low-pass filter on it and take it out for a short walk in a wink.

1273. FCC Proposal for New Novice Class License

Newsgroup: rec.radio.amateur.policy
Date: 2001-01-21 16:52:17 UTC
From: horseshoestew@my-deja.com
Message-ID: <94f440$mh4$1@nnrp1.deja.com>
Source record: 1523
Cross-posted to: rec.radio.amateur.policy,alt.radio.family

Based on the inputs I have received, I have updated my proposal for a new introductory license to more closely reflect traditional Amateur license regulations, with minor modifications to reflect today's changing dynamics.

At this point, I would appreciate more constructive criticism. I understand that many of you are against change of any kind - but you must have something positive to say, or their must be something you can think of to improve things.

****
Proposal to FCC to reinstate the Novice license class in the Amateur Radio Service - REV A

In the late 1980's and early 1990's when the current Amateur Radio Service Technician Class license was conceived and implemented, it was an appropriate alternate introductory license class. However, due to the recent elimination of the Novice Class license, and as a result of improving technology; the Technician Class license no longer serves well as the only introductory license, as it is doing poorly in drawing young members into the Service. As a result of license restructuring, it is now actually harder for young people to obtain an Amateur license than it was before restructuring.

In this critical era of global competition, especially in the wireless communications arena, it is essential that we provide a means for properly educating our young people in RF communications operation and theory.

Today, technologies like the Family Radio Service, high-speed telephone & cable modems, the Internet, and inexpensive cellular telephones, have overshadowed the privileges of the Amateur Radio Service, and made the requirements for young beginners to obtain a Technician Class license out of date. Additionally, the Technician Class license has now evolved into a beginning and ending point for most Amateurs now entering the service, who are mostly interested in VHF/UHF communications, rather than HF communications. Incentive licensing has virtually been eliminated.

The need for a Service dedicated to the goal of teaching young radio users proper radio operation techniques and etiquette can clearly be seen in the disarray present on the 11 meter Citizen's Band Service frequencies. The fact is, the Citizen's Band has become the defacto introductory service for young people just beginning to learn to experiment with radio; yet the Citizen's Band is a very poor

environment for young people to be learning in.

Therefore, it is recommended that the Novice Class license reinstated in the Amateur Radio Service, with minor modifications to requirements and privileges to reflect the today's changing dynamics in radio technology and usage; and to expressly encourage young individuals to enter the Amateur Radio Service to improve their understanding of RF communications theory and operations, provide a healthy learning environment, and encourage radio experimentation.

On VHF and UHF frequencies, the privileges and restrictions will be the same as exists for the current grandfathered Novice Class license, with the addition of a small set of frequencies on the 70cm band, restricted to an output of 5W PEP.

On 70cm, Novice licensees would be restricted to voice communications on 5 20khz-spaced channels on 446.00, 446.02, 446.04, 446.06, and 446.08 Mhz; and digital communications up to 19,200bps on 1 simplex-only 60khz bandwidth channel on 446.14Mhz.

New Novice Class license holders would not have any privileges on HF frequencies.

Consistent with the implementation of the No Code Technician License, in which the existing Technician Class license holders were placed in a new class known as Technician Plus, existing Novice Class license holders would be placed in a new class known as Novice Plus. Novice Plus license holders would hold all the VHF/UHF privileges of the new Novice Class license, plus their existing HF privileges. Consistent with the manner in with Technician Class license holders may upgrade to Technician Plus by passing a 5wpm Morse Code examination, new Novice class licensees will also be allowed to upgrade to Novice Plus by passing a 5wpm Morse Code examination.

The new license class would have the following goals:

1) Encourage more young people to enter the Amateur Radio Service, by providing an entry-level ARS license class that includes privileges allowing reliable short-range voice and data communications.

2) Not significantly impact existing users of the affected Amateur Radio Service frequency bands.

3) Encourage basic knowledge of radio, electronics, operating principles and etiquette among a wider segment of the general population.

4) Take advantage of the success of the Family Radio Service, and provide a path for those young users interested in further radio experimentation.

The Novice license exam would consist of 25 elementary questions. Emphasis would be put on understanding the operational, technical, safety, etiquette and emergency questions that relate specifically to

the new Novice Class license privileges. All questions containing calculations would contain small integer(whole-number) input values and have relatively small integer results. Novice licensees would be required to have a general understanding of Ohm's Law and Power relations. They should be required to have a general understanding of how antenna length relates to wavelength; and have a knowledge of transmitter power, antenna gain, transmission line loss, and the ability to perform a simple ERP calculation would be required. General knowledge of simple resistive circuits, and their power dissipation, would be required. New Novice Class licensees will need to have a basic understanding of digital communication methods. Consistent with the final form of the old Novice Class license examination, knowledge of capacitors and inductors would not be required.

I personally agree with holding on to the traditions. Instead of lowering the requirements to make it easier to get in, we should be making better study materials to make it easier to learn. No sense dumbing down. I'd love to write something like this myself, but just don't feel like I could doa good enough job on it to do itthe justice that it deserves.

Stewart, there was not ONE post of support for your Colt class, and
EVERYONE has stated and reiterated that the Technician Class is about
the easiest license to get in Ham Radio history.

If I see your proposals with an RM on it, I can promise you that I
will submit a vote of "no support" with the FCC, and in discussing this
idea of a NEW license class with some of my local acquaintences, I can
tell you there's no support WHATSOEVER for your proposals.

They are, at the BEST, weak. You forget that the people who will
have to administer this "license" are the VE's, and they DON'T want to
be bothered with a "license" that amounts to nothing more than FRS with
more power and external antennas.

I can't help but think that you are fishing for SOME kind of
support here, Stewart, but there's NONE. The Novice Class as it exists
is all but dead and there is NO interest in reviving it.

The ARRL said no. The FCC said no. The commenting public in
general said no. So what part of NO did you fail to comprehend?

More NG fodder is all you generated, Stewart.

I'll go with the "and others" because the the things Dick protested went the other way in the restructuring. If Dick's protestations had any effect at all, it was to illustrate the absurdity of his positions.

Not "block all change", Stewart. Almost everyone here was for
SOME kind of change.

The "change" you are suggesting offers NOTHING. For only 10 more
qustions on an exam than what you are suggesting, an applicant has
access to ALL Amateur allocations above 50MHz, all modes, and up to
1500W PEP.

There are ELEMENTARY SCHOOL KIDS who ROUTINELY pass the Technician
Class test. They typically pass the test with better scores and in
fewer attepmts than adults. Based on your proposal, the "Colt" class
offers nothing that FRS doesn't already offer, save for more power and
bigger antennas.

Go ahead and "submit" you proposals to the FCC, Stewart. Then they
can tell you "no" too.

One staffer in a bureaucracy the size of the FCC is hardly big potatoes... :-) But I was responding to Phil's post about the viability of ham witnesses for prosecuting ham violations in court, and so my reference to the "Feds" meant Federal Court, not the FCC. What do the federal prosecuting attorneys and federal judges think about bringing ham violations to court? Not much if I understood Phil's past posts correctly. The reason? They think that ham violations are small potatoes. Of course Phil used more lawyerly wording... :-)

Gosh Ed, the tone of your posts are starting to sound ominous. Have
things been going badly for you lately? I am not proud of some of the
wild things that I did as a teenager. However my bootlegging on CW
while waiting for my Novice license to come in the mail was certainly
one of the lesser of my infractions... :-)

Ask about my escapades in my 49 Chevy sometime... :-)

I wish you guys would all go back to 3894.5 14.313 and 3.901
Not that I'm bothered by your postings, not at all !
It was just *alot more fun* listening to it live and in Technicolor
on the above frequencies till R.H. stepped in and killed ham
radio's Comedy Channel(s). How about ad least getting on every
Sunday afternoon for a little radio fun? Shit, it would be alot
better than listening to that screwball prozac-preacher's pontifications!
(the guy who's so batty, he chose a vanity callsign similar to kv4"fz"
retired call - unquestionable proof that this squirrel outside Atlanta is several
bricks short of a load or one paddle short in his rowboat...)
Please? Just a wee-bit of the "good old days" of .313 ? Ad least until OTK gets
back on and straightens the whole thing out.

Stew,

Here are my suggestions for changes to your idea.

License name: "Experimenter"
License term: 1 year, renewable four times in 1-year increments.
License test: 15 questions from current "Technician" pool.
Frequencies: All current and future amateur allocations above 30MHz.
Power: 200W output.
Modes: All authorized amateur modes.
Callsigns: From same sequential pool as current Techs and Generals.

that.

Nor do I. Although I believe that the details should be improved, I think the
growth of the Amateur Radio Service in the days since that very simple
entry-level test was replaced by the more complex VE Novice or Tech tests
demonstrates that the tests never needed to be that simple.

>Today it's all carrots, sticks have become politically incorrect.

I have never felt hit by a stick at any point in my ham experiences. At all
times, whether I entered ham radio and whether I continued it by upgrading was,
and still is, voluntary. IMHO, it runs past the "mores" of today; hitting
prospective hams with a stick is not the best way to get them to participate.

>Unfortunately it looks like desktop computing is now eating
>into our market for the attention of the kinds of folk who became hams
> in earlier times.

Perhaps so. Although surfing the internet is no more than appliance operating
in any sense of the word. Some of those who may have become hams could be
attracted to some of the web-application programming things, but that has been
a "challenge" to us, albeit in a slightly different form, ever since the first
home computer was available. I think that we can take the growth rate of
amateur radio over that time as an indication of its relative appeal.

>>I don't think I would be a ham today if someone had handed me a 200+

>It's not the 4-page book in itself, it's the "serve the appreticeship or go
>thru tougher testing pushups" thing. A bit of pro-quid-pro in play.

Perhaps, but even in 1963, it was not necesary to be a Novice, or even take the
Novice test, before being a General and earning all amateur priveleges.

>quarterly sound OK? Is annualy too long?

The FCC used to require 30 days, if memory served. Of course, it was almost always more than 30 days between test sessions in any particular city. I could live with that. I would support a rules change that required a reasonable waiting period between retests of a failed element.

>Also, Fred was advocating showing a log of contacts prior to upgrading.
> Although a log isn't required to be kept anymore, it really does fall
>back on good amateur practice (oops there's that silly idea again). Or
>merely have a year TIG?

It has been over 20 years since the FCC dropped the logging requirement. Can we trace any problems in the Amateur Radio Service to the lack of logging? Since I have been a ham, showing a log of contacts has not been a requirement to obtain a license that grants all amateur priveleges. When I was a General, renewal required, if memory serves, that a ham make a statement that he or she operated a minimum number of hours. There was also a "time in grade" requirement to upgrade to Extra, but I already had all priveleges, so I felt little or no need.

I don't think any individual could. What you can do is to send your input to the QPC about what material in the tests you don't believe to be relevant, what needs to be improved and as much of the work as you CAN do justice to. They are working on the Extra questions right now, and have asked for input. If you and I are not smart enough to do it, let's not leave it to the 3 QPC folks to do alone. We won't get as good a result as if we all chip in.

So now you'd hold me to keeping constant watch on upgrades to the
question pool? You seem more than willing to just ignore anything that
is negative. I stated that if there are any substantial percentage of
questions in the pool such as the few you posted then that shows some
imoprovement in things. It doesn't mean that the system has been
overhauled.

>
> >ANd you have no idea what kind of a ham I am based on what happens here.
>
> Sure we do, Dick. You have described many of your on-the-air and VE escapades
> here, and, frankly, some of them appeared to me to have been pretty mean
> spirited.

Really? Could I ask you to review some of them here so that I might
consider them for change? I KNOW that is incorrect and blatently false
and your stature has just dropped considerably in my view, Ed. On the
other hand I'd imagine that of Burke & co. has improved accordingly, so
your mission may be showing some signs of success. It is particularly
offensive that you should assert that my "escapades" as a VE to be
meanspirited. That is as false as any prevarication ever has been. In
EVERY instance of any issue whatever I ALWAYS went as far in favor of
the applicant as the rules would allow in their most liberal
interpretation, and I would fully invite anyone to simply ask any
applicant who ever tested with my team that question. That attitude cost
me a lot of extra work since many applicants travelled long distance to
test with our team, having heard of our astute fairness as opposed to
other teams who were not.
The fact that you would make such an assertion without any even
marginal evidence is revealing. You evidently want to cast me in a
negative light for puposses of advancing The Agenda. OK, so be it. I can
live with that,m false as it is. I know how much of an outright lie it
really is and that is sufficient.

> Do you really reserve such conduct ONLY for what happens here? Why
> would you feel that you don't feel to be appropriate on the air or in your
> in-person social dealings with hams is appropriate here?

Do you really have to ask??? After the drubbing the Freebanders posting here have laid out on anyone who supports any sort of code test? There is no doubt of it, therre are many llcensed hams who are also Freebanders. It's a fact often proven by the FCC. You think they just keep quite about the code? Some of them have even obliquely admitted it right here.
What you are doing is demonstrating clearly the future planning of the League, whether you know it or not. The policy fo the League is becoming more and more clear as all this progresses. Yes, it may be your personal opinion. That doesn't mean it isn't also that of officialdom. It more clearly shows that it is.

For most of the
> people here, what happens here is the only basis on which they can interpret
> and judge the worth of what you are saying.

Well what I am saying is not obscure. Hams should have sense and initiative to get to know ham radio and what it consists of, rather than just bringing only their own wants and wishes and forcing the rest of the hobby to conform to their
wishes. But that is far to out of touch with the PC world of today. The league is falling right in line in the ongoing effort to keep up the bottom line. So be it.

Richard,

I tend to agree. While he/she may have a valid "legal" point, I can't help but notice how *badly* kids are treated these days. You know, the "necessary" car at 16, money to buy huge amps for their stereos, pagers, cell phones, more money to "slam" their cars, put funky lights underneath them, hydraulics. I mean, what's 20 grand these days? My, my, how badly they are treated! I hope we never have another depression to contend with. What would they do without all those "necessities"? To see the most recent generations deprived of such would scare me to death. Really! How would they react to having to WALK to school or (HORRORS!) ride a school bus, do without a cell phone, or a phone altogether. Tragic.

The sad thing is, that the abundance of "things" and electronic media has helped in the decline of education. I mean, when it seems that everything is just *there* for the picking, why does one need an education? For the kids coming up today, they have no concept of hardship or the inability to get a decent job. It's all out there, right? They have never really had to work for anything--not all, but most. Parents just hand out money and goods. Instead of coming home from school, and feeding the chickens, gathering eggs, slopping the hogs, watering livestock, many come home to an empty house, a pop-in pizza, and Nintendo. Anything the kids do is OK, and don't the teacher DARE try to keep order or respond to impertinence. It would seem that the rules require that if a teacher comes under attack, he/she must stand there and not dare defend him/herself. I'm glad that I didn't do what I started to do for a career: English teacher. I wouldn't have lasted long in today's environment! The first time a kid attempted to smack me, he'd better have filed a flight plan, cuz he'd be going for a short "flight"! LOL! So my career choice (railroad) was the better one!

Cell phones in school? I may be missing something, but I don't see the need for kids to have them at school. Again, the person *may* have a legal gripe against the school. However, I wonder if it is a matter of resolving a legitimate gripe, OR just a way of one-upping "authority".

You are missing many things. Cross-posting is for brain-dead people that have a over-emphasized imagination that their opinions should be transmitted all over the world. Just post it where it belongs. the alt.family.radio newsgroup is really an FRS newsgroup. FRS is NOT a hobby radio service. If you don't understand the word "hobby" as it pertains to radio services, have someone explain it to you.

Condensed version: Cross-linked messages are lame. FRS is not a hobby service.

Unfortunate truism demonstrated by a few in here.

That may be the source of the continuing mantra of "getting
the young involved in amateur radio."

Such are at a loss to handle adult major-league players
from another "club." It is easy to cow children, to belittle
them. Gives them a feeling of Power, of Control, of
Turf Ownership. Doesn't work with adults not intimidated
by their self-professed "superiority."

That assumes that only narrowband, conventional receivers are used to monitor the wideband signal. The RF energy is literally spread so wide across the baseband spectrum that the energy in a tiny fraction of the spectrum is very low.

You cannot really explain this "UWB" without first going through a tutorial on direct-sequence spread spectrum basics. The narrowband concept of radio is too fixed in most minds to accept UWB immediately.

1947 was a pivotal year in radio-electronics. Not only did Harvey and Wells come out with their multiband transmitter [:-)], but the transistor was invented and a young genius named Claude Shannon came up with the relationship of noise, bandwidth, and information rate. While the rest of the radio world followed "Shannon's Law," amateurs were seldom aware that it applied to amateur radio. That may be because Shannon started off using TTY as the base for his analysis. Everyone (well, most...) "knows" that amateur radio is all about CW on HF, therefore anything that started off with TTY in 1947 can't be any good.... :-)

>
>Slick! I haven't seen or heard about one of those for probably 40 years.
>How'd you get it? VFO included? Might be worth some bucks.

I had to do a web search for the item due to lack of memory on
anything but the name. :-)

Designed (!) in 1947 for "'all' the amateur bands," it looks like
a classic kluge with a front panel layout straight out of 1930.
Using an 807 as a final "on up to 148 Mc [sic]," it probably
has zilch efficiency above 30 MHz.

Messrs Harvey and Wells never produced a receiver according
to the website and the company ceased in 1960. They never
produced any SSB transmitter...explaining some of the lack of
product recognition.

If this particular product is so wonderful that it becomes a
notable exception to a general rule, then I would think that
some ARRL Lab moonlighting with test equipment can
exemplify its bona fides as an "all band" transmitter.

Boatanchor stuff is nice nostalgia material. Long-timers can
wax enthusiastic until the sun shines brightly on the polish
but very little of the old stuff can glow visibly against the
brilliant light of newer, state-of-the-art equipment.

Jim may have taken an oath to defend and protect the constitution
against all enemies, foreign or domestic at some time in the distant
past. I don't think he realized the gravity of that oath. And unless
he's revoked it, it probably still stands.

Imagine Jim trying to call CQ with three missing front teeth. Give him
a pass on that self inflicted beating. Brotherhood and fellowship and
all that feel good stuff in DeSoto's paper.

Chip? Because you cannot provide a single rational argument to keep the
code, we have a chip? The FCC agrees, so the FCC must also have a chip.

Now the ARRL asks yet again to substantiate keeping the code
requirement. I hope you don't trot out the same lame excuses.

>

And here we come to the point of my argument. There is much more to being a ham than being a Novice. The Novice ticket should be what it was meant to be- a quick entry level ticket that allows one to do the investigations and polish their craft with hands on experience with other hams before graduating to far greater priveliges as a real ham. The Code requirement was much more fun and doable with others to practice with, and one would obtain much of it in the Novice bands.

The Tech license questions I do admit are not technically simple, however the testing proceedures have been greatly simplified to the point of instant gratification and conveys "all the priveleges that anyone would want" in a day or two without requiring any further advancement in the craft. In my opinion, an attractive dead end that completely invalidates incentive licensing and the "Basis and Purpose" of Amateur Radio.

You must admit this had the effect of splitting Amateur radio into two factions; The Techs who felt there was really nothing more to ham radio, and the rest who wondered why these people didn't want to join the Ham fraternity (which seems to be almost gone now except for a few that remember what it was like to just be hams).

In my opinion, there should be a "beginner's" ticket that is restricted in band priveledges and only good for a year or two, that requires on the air experience and some further investigation (maybe like elective merit badges?) before upgrading and being accepted into the mainstream.

Let's face it; in order to be accepted as one of the crowd, you at least have to have something in common.

Also, I not accept the notion since we are all born "equal in the eyes of GOD" that we are all the same and thus should be able to have anything we want. If that made sense, how come I'm not a Millionaire? I really want to be a Millionaire but no one will give me a million dollars! It's just not fair! Of course the fact that I'm not much good at making a million dollars should have no bearing...

Welp, JLE had his chance to comment on the nprm or whatever it actually was several years ago. I wonder what his comments were. He's welcome to propose his changes, but I don't think the FCC will entertain his Lodge entrance requirement to the amateur service.

So your opinion is that when a CBer gets a minimal ham radio license
and brings his entire repertoire with him, steadfastedly refusing any
hint of change by way of dropping at least most of the "ling" and sort
of rubs in everyone's face, then we hams should just shrug and give it
all up. We see. You're beginning to look like a limp noodle yourself.
I know of two meter repeaters which have been abandoned to them, and
the hams just moved and put up another repeater. If you think I'm the
only ham who sees it this way you're head is deep in the sand.

Dickie, you can always move to Los Angeles. No problems
with LA municipal Department of Water and Power
electricity. No outages, no shortages, ten cents a KWHR
for residences. Good future for LA.

Of course, there's earthquakes here. But...you know all
about earthquakes, once reading a book on the subject.

On the other hand, maybe you could "reactivate" that CW
net into the LAPD...you know, the one the LAPD didn't
know about until you "revealed" it to everyone? :-)

>The Tech license questions I do admit are not technically simple, however the testing proceedures have been greatly simplified to the point of instant gratification and conveys "all the priveleges that anyone would want" in a day or two without requiring any further advancement in the craft. In my opinion, an attractive dead end that completely invalidates incentive licensing and the "Basis and Purpose" of Amateur Radio.

And the "Basis and Purpose" clause, 97.1 leads me to wonder how CW mode could be considered invalid.

If we stop to consider that CW only requires the least expensive, simplest to construct and is completely compatible with SSB reception, while being more reliable in terms of signal to noise ratio, how could it be that it has been banned for ships at sea and from other government circuits that claim to be for Emergency back-up?

Perhaps a ship at sea that cannot afford (or maintain) Satellite linked e-mail and weather fax is not worthy of rescue?

How do they resolve this inconsistancey?

Perhaps if there were at least a code test for SOS, the point would be made.

>> Gosh Ed, the tone of your posts are starting to sound ominous.
>
>What, for bringing any mention of your anonymity into a discussion?

Do you think that my conduct would improve if I gave my call? Do you doubt that I am a ham? And if I were not a ham would it make a difference? Are you proud of the way some of the call letter identified hams here represent themselves and ham radio? Isn't it better to judge a person by his conduct and ideas rather than by whether he has call letters and/or is willing post them or not? We have discussed my anonymity here ad nauseum. That's not a problem for me. Continue the discussion as long as you like. I will respond to any and all of your concerns. But all of the answers can be found in deja.com many times over...

The ominous tone of your post that I was referring to was your use of the personal comment: "It is too bad that there are things in your life that you are ashamed to admit to." How many things in my life do you know about that I am ashamed of? And if I won't admit to them how do you know about them? And why is it too bad? That was simply a personal attack Ed, plain and simple. As I said, that's not like you, some others here maybe, but not you... :-(

I love it when clueless people try and tell other people how to live
their Usenet lives. They have been the same for many, many years.

You clearly have no idea about the history or the intent of Usenet, and
you sure as heck don't realize why crossposting was invented at the
outset of Usenet.

I'm not going to bother to tell you why crossposting is STILL
necessary. You should have read the FAQs by now.

BAH!!

My proposal to eliminate any requirements for a license will obviate any

Besides I am still upset that my last submission, while being assigned an RM
was not adopted.

Dwight, as I posted earlier, I don't care what words you use as long as they are ones that a person would say in front of their mother (assuming she is not a Jerry Apringet reject)

My objection is to the over sensitive, feel good nonsense that ANY criticism is bad and will cause the little darling to fold up their tents and go home.

No Brian, I have reevaluated my position. You. Ed, and Cecil have convinced me I need to be a sensitive 90's kind of guy. This caused me to create "No Hassle International". My goal is now to remove any restrictions that a newcomer may find demeaning, hazing, or might have a chance, no matter how slight, of damaging their self esteem.

I am now on a holy crusade, With the FCC's help, we can set up tables at the mall and pass out Extra Class licenses as people walk by. We are guaranteed growth and many new young people to keep Amateur radio alive.

I thank you all for causing me to realize my insensitive ways. How could I possibly be such a dolt as to expect anyone to learn something, and treating a radio service that everyone has a "right" to as a privilege. Mea Culpa Mea Culpa Mea Culpa.

If only I can receive the absolution from all the CBers and children, I have caused any moment of agony, I will sleep so much better.

>of rubs in everyone's face, then we hams should just shrug and give it
>all up. We see.

No, my opinion is that there is no reason to publically berate a new ham
because he doesn't choose exactly the language you would use.

Do you really see things in such extremes, or do you blow them up out of
proportion because you believe it makes your point.

>You're beginning to look like a limp noodle yourself.

A petty insult that does not make your point, either.

>I know of two meter repeaters which have been abandoned to them, and
>the hams just moved and put up another repeater.

Are you really telling me that a group of hams put up a repeater, found it
taken over by "them" and so they put up another repeater, and just gave the
first one away? Sounds like another exaggeration to make a point to me.

> If you think I'm the only ham who sees it this way you're head is deep in the
sand.

No, I do not believe that you are the only ham who believes as you do. I do
believe that you represent only a relatively small number of hams. I don't
believe that most hams think that because I have an opinion that it is
inappropriate to publically berate a newcomer over a minor point that I am
advocating letting vast hordes of CBers run over ham radio and use CB lingo on
the air instead of ham lingo.

>Lodge entrance requirement to the amateur service.

Restructuring would have been an ideal time to bring up the issue. I haven't read every comment; the lack of a waiting period may have been brought up by someone. It would appear that either hams didn't think it an issue or the FCC didn't think there was any problem that needed solving.

I guess the doom-and-gloom contingent is down one point on this one. :-)

>From: xjim@my-deja.com

>And here we come to the point of my argument. There is much more to
>being a ham than being a Novice.

Yes, and there is mouch more to being a ham than being an Extra, too.

>Novice ticket should be what it
>was meant to be- a quick entry level ticket that allows one to do the
>investigations and polish their craft with hands on experience with
>other hams before graduating to far greater priveliges as a real ham.

The Novice ticket was not that in 1963; it was quite possible to skip the Novice, and the Novice test altogether and get a General. A drive to the FCC office, a written and code test, a three week wait for the license and instant priveleges, No need to graduate -- one could be there -- 1963.

>The Code requirement was much more fun and doable with others to
>practice with, and one would obtain much of it in the Novice bands.

Yes, they would. Now, have the pro-code folks in 2001 been making it sound like it is fun and doable? >The Tech license questions I do admit are not technically simple,
>however the testing proceedures have been greatly simplified to the
>point of instant gratification and conveys "all the priveleges that
>anyone would want" in a day or two without requiring any further
>advancement in the craft.

Just like it was in 1963. One could take the Tech or General with no previous experience.

>In my opinion, there should be a "beginner's" ticket that is restricted
>in band priveledges and only good for a year or two, that requires on
>the air experience and some further investigation (maybe like elective
>merit badges?) before upgrading and being accepted into the mainstream.

Did you make this suggestion to the FCC? What did they have to say about your comments in the Report and Order?

>Let's face it; in order to be accepted as one of the crowd, you at
>least have to have something in common.

Man, the things we have in common are so much more than our differences that I don't even know where to begin.

>Also, I not accept the notion since we are all born "equal in the eyes
>of GOD" that we are all the same and thus should be able to have
>anything we want.

I do believe that we are equal in the eyes of God, but that means that we have an equal opportunity to live the path that has been placed before us. I don't know anyone personally who believes that we are all the same and thus should be able to have anything we want. This seems to center around this forum; can you tell me who you think believes this way and whether you think that their belief is held by a majority of hams?
>If that made sense, how come I'm not a Millionaire?

Perhaps you could ask the God you cited in your post.

>I really want to be a Millionaire but no one will give me a million
>dollars! It's just not fair! Of course the fact that I'm not much
>good at making a million dollars should have no bearing...

Oh, now I think we know who believes this way. :-)

What percentage of CW operation do you think is carried on usign the least expensive, simplest equipment vs using the new-fangled, microprocessor controlled transceiver?

>while being more reliable in terms of signal to noise ratio, how could
>it be that it has been banned for ships at sea and from other
>government circuits that claim to be for Emergency back-up?

I lack your expertise in determining what emergency equipment should be on ships, but in my humble opinion, they probably make the choice in terms of reliability. If I were on a sinking ship, I would trust that they would have a satellite rescue system instead of a 500-kHz Morse transmitter.

That would be a reasonable analogy.

>>Depending on its modulation characteristics, UWB
>>can produce discrete modulation sidebands or can sound noiselike.

>That assumes that only narrowband, conventional receivers are used
>to monitor the wideband signal. The RF energy is literally spread so
>wide across the baseband spectrum that the energy in a tiny fraction
>of the spectrum is very low.

Yes, it is very low, Len, but very low can be used quite effectively for communications. Run a few calculations. Start with 30 dBm UWB spread over 1 GHz bandwidth, 10 dBi antenna gain on transmit, 20 dBi antenna gain on receive, a 6 dB receiver noise figure, a 1 kHz receiver bandwidth and a frequency of 1200 MHz and a separation of 0.1 kM. The result is:

Frequency = 1200 MHz
Total transmit power = 1 watt
Transmit spread = 1000 MHz
Receiver bandwidth = 1000 Hz
Transmit power in 1 Hz = -60 dBm/Hz
Transmit power in 1000 Hz = -30 dBm
Transmit antenna gain = 10 dBi
Receive antenna gain = 20 dBi
Distance to receiver = .1 km
Free-space pathloss = -74.03362 db
System loss (path loss +/- antenna gains) = -44.03362 dB
Total loss (path loss +/- antenna gains - spreading loss) = -104.0336 dB
Specified receive system Noise Figure = 6 dB (includes external noise)
Calculated receive system sensitivity in 1000 Hz bandwidth = -138 dBm
Received noise in receiver bandwidth = -74.03362 dBm
Received noise in receiver bandwidth = S 9
Receive system noise floor increase in dB = 63.96638 dB

Put that UWB transmitter on a good location and go out to 10 kM and you are still hearing -114 dBm in a 1 kHz bandwidth narrowband receiver under the conditions I stipulated.

Put a 0 dBm UWB transmitter in the house next door, 0 dBi gain antenna, 30 meters separation and you receive -104 dBm under the stipulated conditions.

I am not necessarily advocating that UWB should not be allowed, but the oft-cited lack of interference because the signal is spread out over such a

wide frequency range does not mean that it won't be heard by narrowband receivers.

I agree. If I am going to do any moonlighting with test equipment, it will be to compare the Elecraft K2 to an old Collins S line receiver. I will wager that famous lobster dinner if I get to pick the side I want to be on. :-)

I am serious as a heart attack, as I posted in a message to Brian. You, Brian and Cecil have made me change my ways, I am now a new sensitive creation of the 90's. I spend every minute seeking absolution for my old ways that erroneously thought rewards should come from effort.

Little did I realize that I was simply building monuments to my own ego by depriving someone of what they wanted simply because I worked to gain the same privileges.

I have seen the light, and as soon as the FCC sees things my way, I will be the first to set up a table at the mall to pass out Extra class licenses to any and all that want them. Our ranks will swell and Amateur radio will be saved.

We don't need no stinkin' colt license.

Making assumptions again ED? Where did I say that *I* publically berate
any new ham or anyone else "because he doesn't choose exactly the
language I'd use"?
I *didn't*,I *don't*, never have, don' expectd I ever will. We both
know that it is sometimes done. That doesn't mean that I have done or
ever would do it. I like the others just move to another repeater. I
might just put tone control on it and fail to give the miscreant the
code,it he continues to flaunt his CB background in every ham's face.
That sort of behavior doesn't seem to bother you a bit.
And: I thought it was you who said that what happens on this NG doesn't
reflect reality in ham radio. Changed your mind, I see.

>
> Do you really see things in such extremes, or do you blow them up out of
> proportion because you believe it makes your point.

Another poster mentioned that sometimes newcomers are corrected on the
air and suddenly you leap to their protection whether or not it is
needed or even wanted. I made the comment that when they refuse to learn
how to act on ham radio that's when the hammers come out, and suddenly
I'm an ogre. Time to get hour head on straight Ed, it ain't me that's
the problem. And that remark about my nefarous activity as a VE in the
face of the facts which are 180 degrees out is way beyond anything I
have ever heard done to any newbie on the air. I guess only newcomers
are subject to being offended and they by the slighest effort to help
them being misinterpreted at harsh criticism! Amazing! IF this is what
the hobby is coming to, I think I'll take my grandson and go fishing. If
ham radio is turning into nothing but a PC feel good sideshow where
honest efforts to help a new ham by offering advise -and I don't mean
the sort of crapthat Paranoid Burke worries incessantly about- then you
won't have to worry about me intruding in your utopian fun. I'll be
somewhere doing something I can enjoy and it won't be in the middle of

that nonsense.
I gotta decide by April whether or not to renew my ARRL membership.
Gotta tell ya, it doesn't look to promising right now. Oh, I'll keep my
ticket, that's not going away. Been a ham way too long to just hand it
over to the Fragile Ego CBers, but I can sure hang out somewhere I don't
have to worry about running into any of them. You won't find the Burkes
where it takes any effort to use the resident modes.

Probably. But that you have found your way to rrap AND
alt.radio.family is evidnece it happens. You could of as easily sent
me an e mail.

>FRS is not a hobby service.

If you read the basis and purpose of BOTH Citizen's Band (of which
FRS is part and parcel of) and the Amatuer Radio Service, you would NOT
find the word "HOBBY" in either, yet both are used for that purpose.

That they are used for that purpose is obvious. That includes
FRS. You may not wish to apply that word (hobby)to it, but that's
exactly what a great many people use it for.

The Bandmaster was in the ham magazine ads when I was just getting interested in radio, well before I became a Novice. It just sparked some very old memories, that's all. I'm not into boat anchors any more than I'm interested in collecting antiques in general. Momentarily interesting but no thankew. I recently saw an an SX-88 bid up to $2,800 in e-bay, spare me. Every piece of ham gear I actually use is solid state stuff including an NRD-545 which has 40-bit DSP at the IF level. I happen to have a Collins 75S-3B and a Drake R4-B which are getting a bit long of tooth but they both still have better ears than the current crop of lower end xcvrs.
>
Running an 807 on 2m was definitely a stretch but it did put more of a signal on the band than a lot of the popular 50s 2m xcvrs like the Benton Harbor Lunchboxes and Gonsets, etc. Plus it was 100% modulated AM, not the lame screen modulated crap which was more common.

That's a matter of opinion, a discussion which could go on forever. What is not a matter of opinion is the obvious fact that Novice test worked very well in it's timeframe. Ham testing has been a cyclic thing. It's run from the much easier days of the 50s to the Draconian Incentive Licensing maneuver to the nocode ticket, etc. They all worked in their timefarmes. I just don't want to see the tests eventually watered down to to the point where they permit what would amount to a free pass to the bands just to prop up the license count.

Computers in fact are a big asset to ham radio these days in several respects, the damned things are almost becoming a necessity.
>

> I think that we can take the growth rate of
> amateur radio over that time as an indication of its relative appeal.

>
I agree. I'm not wringing my hands over the imminent death of ham radio.

>
> Perhaps, but even in 1963, it was not necesary to be a Novice, or even take the
> Novice test, before being a General and earning all amateur priveleges.

>
No, It wasn't necessary, none of it was "necessary" but it got a lot of new hams on the air who have not have bothered otherwise. You could have gone straight to the Extra for that matter and some people did. My neighbor AF3F was a avid CBer in the 70s who got a whiff of ham radio in my shack, the only license he's ever held is his 20wpm Extra.
>
The writtens never were any kind of big deal back then, the thrash over the writtens didn't start until the question pool nonsense came into play.
>
Certainly in my own (lame) case as a kid I made good use of that first year on the air. I had junk equipment which needed constant debugging from which I picked up a lot of on-the-fly technical skills. I'm not sure if I'd have pursued ham radio if I had to take the 13wpm test out of the box. Thousands jumped on the new opportunity to get up to 13wpm on the air. Instant gratification leads to learning in the right setting. Which was the bottom-line design intent of the original Novice ticket.

Dave, it is not nice to pick on older people. Len's "old timers" disease sometimes causes him to strike back without thinking.

What I took as mean spirited responses to my messages turned out to be caused by the lateness of his social security check.

It appears he had no money to purchase a new box of depends, and the overflowing contents happened to get intertwined with his messages.

Len, you are the crabgrass in the lawn of rrac.

The Bandmaster was as much of an "all band" rig as one could get at the time of its production. No, it wasn't efficient above 30 MHz but it worked. It may not have had the best electrical design but it was a mechanical marvel with its right angle drive. It is also very compact. The matching VFO was designed with a slanted panel and a nice flat and low rectangular area where the transmitter could perch atop the VFO. I have two, one of them with the VFO. I'd be happy to sell you one so that you can spend hours admiring it. With luck, you'll be able to get a license and use it on the air.

Yes, the company did produce at least one receiver.

You can tell the '57 Chev collectors that their rides are deficient but I doubt you'll get any of 'em to trade them in on a new Taurus or an Intrepid.

Would you like me to send you a copy of "Now You're Talking"?

More "jargon". When the term started, I was working for a
supervisor named Elmer who was a ham. He was a much better ham
than a supervisor, but what the heck, his idea of ham radio
was CW on HF. He could copy 40 wpm in Japanese Kona code and
had the paper to prove it. My first thought on hearing "Elmer"
so used was "why Elmer".... <ggg>

I still do my share of "Elmering" though but I don't call it that.

>the bands just to prop up the license count.

Nor do I, Brian. To the contrary; I have oft' said that the tests need improvements like questions about the fundamentals of modern radio technology and more questions on the formulae type questions. I have been having long talks with Bart Jahnke, ARRL's rep on the QPC, to find out what it would take to make it happen.

>That one year or hit the wall was definitely a stick IF you wanted to stay on
>the air. Which of course was strictly optional.

I didn't feel hit by it. If I hadn't been so lazy, I would have studied the 16-page study guide and practiced Morse code real hard and been a General right from the get-go.

Even then, I think the incentive of wanting more frequencies was more responsible for my upgrading to General than was the 1-year term for the Novice license.

I know two career Novices, who have renewed that license for years. Is amateur radio harmed in any way by their presence in our ranks? If we hit them with a stick, they simply won't renew next time. In what way would that benefit amateur radio?

>I have seen the light, and as soon as the FCC sees things my way ...

I will believe that you are serious about the changes you propose when I see you file a request for rulemaking with the FCC. If it gets as far as an NPRM, expect most hams who file comments to oppose it.

It looks to me like another version of "if you won't play the game my way, I am going to take my ball and go home."

The only problem with that is you don't own the ball. :-)

>So now you'd hold me to keeping constant watch on upgrades to the
>question pool?

If you are going to criticize the pools and the people who take exams derived from them, I believe that you should have at least looked at the pools before you did, yes.

>You seem more than willing to just ignore anything that
>is negative.

Not true, Dick; I have posted my own opinions about what is wrong with the question pools and amateur radio. I just don't think I have to take a positon that the entire process if somehow not of any use because there are a few things that should be made better.

>> Sure we do, Dick. You have described many of your on-the-air and VE
>> escapades here, and, frankly, some of them appeared to me to have
>>been pretty mean spirited.

>It is particularly offensive that you should assert that my "escapades" as

>been. In EVERY instance of any issue whatever I ALWAYS went as far
>in favor of the applicant as the rules would allow in their most liberal
>interpretation, and I would fully invite anyone to simply ask any
>applicant who ever tested with my team that question. That attitude cost
>me a lot of extra work since many applicants travelled long distance to
>test with our team, having heard of our astute fairness as opposed to
>other teams who were not.

I agree; my choice of words could very well give people the wrong impression that you did not conduct yourself as a VE honorably. I do not think that you would do anything inappropriate in the admiminstration of the tests. I just can't imagine how the attitudes you project here could not have been present at the sessions, however; why would you treat people any differently here than you do in person?

> What you are doing is demonstrating clearly the future planning of the
>League, whether you know it or not.

Now, could that fall into the same "outright lie" category as the words I chose about your VE testing? If ARRL is smart enough to realize that there is some merit to some of my views, I will be pleased, but, IMHO, that outcome is not at all certain. That is the reason I posted here several times that it is important for people to make their views known about this to their Director, and I hope that YOU did, too, Dick.

> The policy fo the League is becoming more and more clear as all this
> progresses. Yes, it may be your personal opinion. That doesn't
> mean it isn't also that of officialdom.

I hope you are correct, but if ARRL were to adopt the positions I have offered are best, it would not be because I posted them here.

> The league is falling right in line in the ongoing effort to keep up the
> bottom line. So be it.

I can name a lot of things the ARRL would not do if the "bottom line" were the only concern it had, Dick. You can go to the ARRL's annual reports and note that the bottom line is zero every year; the amount of revenues is directly related to what the ARRL can do. This year, I wouldn't be surprised if the ARRL will run on a slight deficit. I hope so, because one of the things on the plate is an additional ARRL staffer, who will be tasked with undertaking some of the work involving RFI to hams. Between powerlines and Part 15 devices and upcoming technologies like digital cable, home phone networking, home power-line networking, xDSL, Blueetooth and a number of others, things are not looking good for HF or microwave allocations. As one who wants to see this work get done, I am glad that some attention is paid to the finances, Dick.

But if you really think the "bottom line" is the only "agenda," why did the League not support one license class with a requirement to sign one's name on the application? It proposed something that was more than the FCC, and apparently many in the Amateur Community, was willing to accept. IMHO, that proposal was influenced very much by the input of hams like you, in tandem with input from hams like Cecil or Brian. The ARRL's position was a compromise position that included your point of view as one of its components. If your response is "bottom line" and "agenda," and you put that response into your input to your Director (would you treat us any differently than you treat him?), how do you think that such a response to ARRL's past actions will affect its future actions?

>From: Brian Kelly kelly@dvol.com

>The K2 will have a better front end but when you move down the chain and run
>into the filters it'll be all over for the K2.

Maybe. I think the skirt selectivity of the old Collins may be better than some modern rigs, but certainly not all modern rigs. Care to stack the skirts of the Collins up against the IC-756PRO?

I also want to look at what is still a problem for many modern rigs -- in band IMD, ie, the intermodulation that occurs when two signals are present simultaneously in the receiver passband. Most current equipment doesn't do very well in that regard and I want to see how the old Collins S line did.

Actually, I am pretty serious about all this. I have asked our test engineer to get a few of those old receivers and take a look at them.

>The K2 is a puzzlement. The thing has a kilowatt receiver and a five watt
>transmitter in the same box.

I do know that 5 watts was the design goal. It was intended to be a QRP rig. The designers can't help if if they happened to design a receiver that is better than most. :-) And do remember, "better" is a relative term. It does indeed have superior dynamic range characteristics, but it also lacks many of the features that hams buy "big" rigs to have. For most hams, with modest antennas, features are more important than dynamic range.

> these folks were against lowering the CW requirements.
> They are still in the "block all change' mode.

Stew,

To set the record straight, here are some of the changes I
have recommended to the FCC.

During the "restructuring" NPRM period I recommended that
the number of licenses be reduced from 6 to 2. The FCC met
met me halfway, and reduced it to 4.

I recommended the top CW test speed ought to be 5WPM. The
FCC agreed.

I supported the vanity call sign system. The FCC agreed.

I have recently supported a recommendation that Novices be
granted the same CW priveleges as Generals. The FCC has not
yet ruled on that idea.

So much for "against lowering the CW requirements" and "block
all change mode".

The reason your "Colt" idea has gained no traction among seasoned
amateurs is because it is duplicative of the current Technician
class, and because it would segregate new licensees in an RF ghetto,
remote from mainstream Amateur Radio.

Dave, most readers here long ago dropped his posts from their reading list anyway. He has nothing of any consequence whatever to say, never has, only drivel and venomous garbage. It's real easy to just toggle past his entries in the traffic list, and the only time I ever read anything by him is when it is quoted by someone else. Nothing to says bothers me and none of it is anything that I would want to read since I learned long ago what his game is.
Ol' No CW Testicles never has had anything constructive *to* say here, never will. Nuthin' but venom. I ain't buying. NOT sorry either.

Move to Los Angles????
HAHAHAHAHAHAHAHAHAHAHAHAHAHAHAHAHAHAHAHAHAHAHAHAHAHAHAHAHAHAHAHAHAHA!!!!
Funneeeeeeeeeeeeee!

He's insane.

BTW I just checked my utility statment from last month,out of curiousity since it's been some time since I last did. Electricity cost was 7.2 cents per KW... and it's been so long since I've had a power outage I don't even remember it.

Good to see you back, Dave.

Not quite true, Dwight. (In fact, I may actually agree with some of your observations, but that isn't the point.) The frustration arises from what appears to be fairly intelligent people suddenly loosing it and feeling the need (or perhaps craving) to post a subject which has absolutely nothing to do with the charter of the newsgroup. I can only see two reasons for doing this: (1) they're trying to provoke a reaction by deliberately posting something that will offend/irrtate somebody, or (2) they're so emotional about a subject that they feel an uncontrollable urge to make some statement, however inappropriate the forum. If it's case number 2, then there's plenty of appropriate newsgroups out there, and hey, go for it!

In response to W6DKN's comment: you're partly correct, I have been off this particular NG for some time. However, I don't see the logic in the statement that because somebody posts an OT message, it's therefore okay for everyone else to follow suite. Curiously, this NG seems to be particularly affected, whereas posts to the more technical NGs seem to pretty much stay on topic -- although I will agree that not always 100%.

Sorry for the BW guys,

73, Darrell.

The power company here has time of day rates. You can save money by shifting your heavy usage to the cheaper hours. According to what I've read, people respond better to the economic carrot than to the altruistic conservation requests. Although... they might respond more enthusiastically to the blackout stick... :-)

Black helicopters full of jack booted thugs are on the way. They are
equipped with an ARRL mind control device. You will soon learn
what becomes of those who expose the PTCA. Resistance is futile.

OOOOOPPPPPS -- BREAKING NEWS FLASH!!!!

Due to recent budget cuts at ARRL headquarters there are no longer
any black helicopters or jack booted thugs on the ARRL payroll. Also,
the mind control device was recently reposessed by the Newington bank.

Now yer cookin', big issue. Comparisons of IMD might be an interesting horse race
between the pricey old rcvrs like an S3-B vs a 756. I manned the graveyard shft on
20cw last Field Day with a beat-up solid-state clunker, FT-440 or something like
that, I'll swear my old S-40B had less IMD than that xcvr has. Drove me batty.
>

Great, the idea has been floating around for awhile, good to see it coming to life.
Should attract a lot of attention. Lab tests of a late model S-3B and a Sherwood
Drake R4-C vs. whatever might prove to be real eye-openers and reality checks.
>

> better than most. :-)

>
Was not "accidental" . . they busted their butts on it. The K1 is a much more

"balanced" design as far as the rx and tx meeting realistic qrp functionality needs are concerned. If they had a nine-position bandswitch on the K-1 I'd probably go for one.
>

> And do remember, "better" is a relative term. It does
> indeed have superior dynamic range characteristics, but it also lacks many of
> the features that hams buy "big" rigs to have.

>
When I picked up my trusty old used TS-940 I toted up a total of *75* connectors, knobs and buttons. Not counting more contols lurking in menus. And after all that it still doesn't have a simple bandswitch. Once I get the thing hooked up and running I use the same 6-8 controls I used in 1960 for the most part. And the 940 goes back twenty years, the current xcvrs have even more "great features". Utter insanity, VCR controller think. The K2 interface makes a lot more sense to me in this respect.
>

> For most hams, with modest
> antennas, features are more important than dynamic range.

Conversely, as a Novice I was already on the air and having a ball with 5wpm while
you would have been still droning away with w1aw practice sessions to get from 5 to
13wpm. There wasn't no better way to get the speed up than when you got a 10wpm
response to a 5wpm CQ. Adrenalin rush, sweat, sweat, copy, copy. Heh-heh!
>

> Even then, I think the incentive of wanting more frequencies was more

Abolutely no question about that. That particular FCC had reasons for sticking the
Novices in otherwwise sparsley populated segments. I couldn't wait to get outta
those bands and go play with the big boyz after I'd acquired the skills to deal
with them. Fact is that the Incentive Licensing gambit was far more a stick and
carrot thing than the old drop-dead Novice ticket was and Incentive Licensing
happened 17 years after the Novice ticket was introduced.
>

> stick, they simply won't renew next time.

>
As has the rest of life the fundamental FCC philosophies behind the tests changed. The FCC in those days took an agressive, proactive stance with respect to promoting upgrading as witnessed by the time limit they put on Novices back then along with the later partitioning of four HF bands by license class. It was sticks & carrots galore and that's simply the way it was *then*, historical fact. Since then the FCC has opted to change the ballgame in many ways so now Novices can go on being Novices forever. There is an uncountable number of mindsets, regulations, policies, etc. everywhere in life which "worked" in 1968, let alone in 1951 which don't fly today. I'm not passing judgement on any of it here.

I looked closer at the Elecraft web site after I made this post and
discovered that I was in error. Apparently they don't offer this amp
option yet. The specs list says it would be available in Q4 of 2000
but it's not yet on the price list. Too bad because 50 watts would be
ideal for all around CW operation...

I'm sure there are some of those folks around. Perhaps they are
contributing in some of the other "Basis and Purpose" points in 97.1.

Do you think they are harming the Amateur Radio service if they
get involved in ARES, Skywarn and similar endeavors -- 97.1(a)?

Do you think they are harming the Amateur Radio service if they
concentrate on advancing the communications phase of their
skills -- 97.1(c)?

Would they harm the Amateur Radio service if they participate in
SET or Field Day, or local drills to expand the reservoir of
trained operators -- 97.1(d)?

Is there some harm to the Amateur Radio service if they are
involved in DX ragchewing and make some friends with folks
from other cultures -- 97.1(e)?

Or is anything other than technical topics harmful to the Amateur
Radio service?

Steve, being an amateur radio operator, I think you know what is meant by hobby. With amateur radio, you may experiment by building your own equipment, toy with antennas and try numerous means of communications. The FRS and CB services are NOT set-up with these luxuries. They are not a hobby service in the sense that amateur radio is, but rather a consumer oriented radio service where you purchase and make no modifications to and transmit as intended with "off-the-shelf" equipment.

But you're not the judge, Larry. You're not A judge. You don't get to
decide when armed rebellions are legal and when they are not. You can
pretty well figure that none of them are.

> If you are not, then I can understand the problem you're having in understanding > my post.

I understand it perfectly. I'm just not as narrow minded as you are.
It is you who doesn't understand that you are wrong. You might wanna
check with your dad the attorney about whether it's legal for people to
stand on the steps of the Capitol with guns. Let us know what he says
about that.

Ahh, but CB radio DOES allow external antennas, and the fact is MANY
people ARE using it as a hobby. My opinion is that it is a very poor
place for kids to be learning about radio.

I wonder if you mean the oath issued by the United States Government.
Larry is talking about taking up arms against the government. Wouldn't
committing treason violate the oath?

The fact that I never took one doesn't make feel less obliged to support
my country.

The equipment is commercially available at a reasonable price. Many of the kerchunkers also actually operate the repeater, enabling one to capture the fingerprint of the miscreant, then compare it to properly ID'ed signals.

Say Ed, I was wondering, is there any way of getting transcripts from the proceedings that lead to restructuring? My understanding is that there were folks that had concerns about the elimination of the Novice Class license. Is there any way to know how close "the vote" (or general sentiment) was on this particular issue. I don't want to go barking up the wrong tree, you know - but I've got a hunch that there is some support for something that will set up a more healthy learning/operating environment for kids. Why would the FCC have recently created FRS, and now MURS, if that were not the case?

I don't have a big problem with MURS becoming the defacto experimentation Service for youngsters; but I think they WOULD be better off with something like what I am proposing.

>now go back to CA", or some such?

Urban legend and Grand Canard.

What the sign on I-5 just south of Salem (the state capitol)
says is: "Latitude 45 degrees. You are halfway between the
Equator and the North Pole"

Maybe you were thinking of the sign that says:

"Keep Oregon Green. Bring Money."

Maybe you were thinking of the (legendary) sign at the entrance
to San Diego, long a hotbed of crusty old Republican retired
Navy brass:

"Welcome to San Diego. Keep Right."

NO! REALLY! I didn't know that. I guess that is why my CB wouldn't
put the "foot" on anyone! GEEES!

A great place for kids to learn about radios IS the amatuer radios
service AS IT IS CURRENTLY STRUCTURED! The Technician class can be
obtained by most any 12 year old and many younger. A give-away ticket
to "kids" is not teaching them anything!

Whether people are using CB as a hobby service or not is irrelevent.
It was never intended to be such. FRS service is not a "hobby"
service. It is a consumer service much like cellular. All these
screwball attempts to expand the FRS service or deminish the amateur
service are perpitrated (sp?) by people with delusions of grandure.

Get over it! The FRS service is fine the way it is...The Amateur
service is fine the way it is...The CB service should be nuked!

Do you consider the current Technician license an unhealthy
learning/operating environment for kids?

LAPD wasn't the California node - CHP Sacramento was. I saw

As I used to preach to those in the Wireless Communications Alliance who though that the spectrum can accommodate an unlimited number of "unlicensed" devices, take a good look at the "unlicensed device" spectrum with a spectrum analyzer and you will see a profile view of a brick on a plate.

"Wanna' tell me that no one knows that it's there?" <ggg>

The reason that the FCC specified "simple formats" for amateur and early commercial spread spectrum was that they could be df-ed with the equipment which we had in hand. When we got newer stuff, the specs were relaxed somewhat.

The Northern Californians and New Englanders (to some extent) were/are hobbled by the mighty Pave Paws (frequency hopping radar) system on the 70 cm band. USAF-SAC, my erstwhile employer, claimed that receiver AGC and squelch response times were much longer than the dwell time on any discrete frequency so it shouldn't be detectable.

"How do you explain why my Motorola Micor squelch trips every time?"

And so on.....

I know that there are some of those folks around. Namely me. I have
really done little but to operate in the last 30 years or so. I left
the electronics industry in 1968 and have not kept up. The electronics
I learned as a ham in the 50's, and in school in the 60's, and which
employed me at Motorola for several years, still serves me well for
hooking up a ham station in 2001. If my rig broke in the 50's or 60's
I could fix it no matter what. Now if it's not a simple problem, it's
back to the factory. But then how is that much different from most
hams these days...

There are several problems with this proposal:

1. As a 15 year old, I can tell you that the most interesting thing of ham radio is DX, not short range VHF communications.
2. This proposal would isolate the newbies, if there are not any other recent "Colt" licensees around, they would quickly grow bored and would not upgrade. Chatting with people who have been around a while and who are talking about the Walk-a-Thon or picnic the local club is involved in or the great conditions on the HF bands today.
3. The Tech license is already extremely easy to get. I got my Tech just over a year ago and it took about a week to study enough to pass the test, and that was with 55 questions on two tests, not 35.

While I agree more young people are needed in the hobby, the problem is not the license structure, which I believe to be perfect, it is the PR deficencies.

What about this as a proposal. Leave everything as it is as far as licenses
are concerned. But, then eliminate the rule that you can't charge money
for testing people. And, then work to get the FCC to cut a deal
to allow, for example, Radio Shack and ham radio stores to give ham radio
license tests right in the store -- and set up a computer system to give call signs
right on the spot. Then, the stores could make a little money giving the test.
And, might pick up some extra sales from new hams.

If real money could be made from the extra sales, the stores would give the tests free.

Perhaps you can ask Radio Shack whether they think your proposal is viable.

Percentages are for insurance companies. In an emergency you would
HOPE to have cellular service.

When I was in the Navy, we had a catastrophic power failure while the
generator was down for repair. We had to pull every quirky trick out
of our hats to bring the boilers back on line. All during that time
batteries went low and and we litterally did this while beating on
failing battle lanterns. We had to call a nearby ship to bring us an
extra 20 gal of Gas for the portable equipment because we had run out.

You better believe we wouldn't have sneered at a HW-7 if it had come to
that.

If you were on a sinking ship, maybe you would want a crew that knew
more than excuses and finger pointing. Anyone who has been on
emergencies knows that half of the newfangled gadgets are worthless in
an emergency. Like laptops and multi-mode controllers that take way
too long to set up and require a pile of support cables and interfaces
to get going, only to have something's batteries go dead.

I also used to support the local Mountain rescue unit with VHF and HF
links, as they often found themselves on the wrong side of the mountain
from HQ. After spending 30 minutes trying to get better than 20db of
noise into the repeater on the other side of the mountain, we would
shift to 75m mobile. After another 20 minutes trying to pass traffic
on 75m phone when the signals were even with the QRN, I never again
forgot the old straight key.

Also, many people seem to think that ham radio is financially prohibitive. You can be a real ham and make lots of contacts with a homebrew CW QRP rig, and get the $20,000 antenna/tower/rig/amp big DX station as you go, and have a ball getting there. We did it then, and people do it now. Besides, if the BIG DX/CONTEST station and the tower were delivered and installed, and you just got the license back yesterday, you've missed out on everything that went before. Truth be known, I'd rather be making that contact anyway, instead of punching through endless menu screens.

My Brother-in-Law's Dad was a ham, but had passed away many years ago. He came to me interested in getting a license of his own. He actually got all hyped up and did the Novice route. He would come to me so stoked about swapping QSL cards and his contacts all over the place with his HW-8. I'll never regret my own triumph of getting something on the air with my own hands and actually making contacts with it.

On the Report and Order thing, I think there was a snafu. I got no response back from the FCC on my comment paper to 98-143 other than an automated receipt, but maybe the tide of popular opinion was against me. Sometimes it takes a while for an idea to gain momentum, but it'll never bear fruit if you don't plant the seed.

Jim, ac6tk

You could even have the test on the computer, the computer than could grade your test(s) and as you pointed out issue your call sign on the spot. Then the computer could pop up what the store had in your price range. You would then press your selections and walk to the front of the store, pickup your license and equipment and head home ready to operate.

We could do the same thing from Mall kiosks to attract young people. This could be coupled with playstation rentals, beepers, and cell phones. A one stop communications and entertainment kiosk. ARRL could create a Sony playstation and gameboy cartridge to teach amateur radio, along with an amateur radio adventure that would require simulated contacts with DX countries to obtain clues to finish the game. Wow! I wish I had thought of that. The only problem is getting it by the old elitist hams that think you should learn a bunch of code and radio nonsense to gain what is rightfully yours because you want it..

I do not think there needs to be a new Amateur service, but I also think you
are perhaps being a litle hard on the guys commercial and money connection
etc. After all, it was Tandy Corporation that made the FRS proposal to the
FCC..and Tandy is commercial for sure..(ie Rradio Shack)

I don't like this idea very much. The part that worries me is as you
say, they "might pick up some extra sales from new hams". Without
accusing any store or anyone of dishonesty, I think it's a bad idea for
the test giver to have such an immediate and direct financial incentive
to have the examinee pass.

Before going any further, I will point out (for the benefit of some readers, not yourself) that Truly Random noise power is ALWAYS additive. Also, a quick and clean way to measure path loss is Loss(db) = 37 + 20 Log F + 20 Log D where F is in MHz and D is in statute miles. [1 Km = 0.6214 miles]

>Received noise in receiver bandwidth = S 9
>Receive system noise floor increase in dB = 63.96638 dB

Okay, some remarks on that. First of all, path loss is frequency sensitive. If the UWB bandwidth is 1000 MHz, then you can't name one frequency as if this is the narrowband kind of thing.

If 1.2 GHz is the low end, then 2.2 GHz would be the high end. The path loss over 1 KM (I don't want a goalpost-to-goalpost communications range of 328 feet...I can shout that far...:-) will vary from 94.5 db at 1.2 GHz to 99.7 db at 2.2 GHz.

The choice of 10 dbi Tx and 20 dbi Rx antennas is curious and there is no additional cable loss connections. I would pick a total antenna plus feedline gain at 15 dbi (assuming a cableless dipole reference standard). Total path loss, antenna gain, cable loss would now be -79.5 to -84.7 db over 1 Km. If the transmitter power output is 1 Watt or +30 dbm, the receiver input port would get -49.5 to -54.7 dbm of total UWB signal.

The calculated noise power of a 50 Ohm resistance at 296.9 K over a bandwidth of 1 GHz is 4.05 microvolts or -94.8 dbm with 0 dbm equal to 223.6 millivolts in a 50 Ohm system. Given a sloppy UWB receiver having a NF = 12 db (accounts for all variables such as A/D processing), the equivalent noise input power over a 1 GHz bandwidth is then -82.8 dbm. Overall signal to noise ratio over a 1 KM path is then 33.3 db at 1.2 GHz droping to 28.1 db at 2.2 GHz. That should be enough S:N tolerance for processing the UWB signal.

My particular peeve with the numbers is that the UWB signal in UNDEFINED. First of all, one cannot assume that the UWB signal (whatever it is) is spread evenly across the entire spectrum. It won't be. If the UWB signal starts as a 0.1 microsecond pulse, the spectral content will show defined energy appearing at 10 MHz increments. If there is some kind of modulation on this 100 nanosecond pulse, then the energy is still spread in 10 MHz increments but has some additional energy clustered at those increments.

An example of this clustering is the US NTSC color TV. The color subcarrier was chosen as an odd multiple of half the horizontal line frequency. Why? Turns out that the spectral content of a black-and-white video signal was clustering around increments equal to the horizontal line frequency. The color information would fit in-between the monochrome spectral content, would not over-ride it, and thus allow a transmitted color TV signal to be received over an existing monochrome TV receiver.

Okay, let's assume the undefined UWB signal does have a totally even distribution of spectral energy over a 1000 MHz bandwidth. As defined, the transmitter output of 1 W (total over the bandwidth) is equal to +30 dbm (to readers, 0 dbm = 1 milliWatt in a 50 Ohm system). Assuming the totally even "spread" of spectral energy over 1 GHz, the energy distribution could be stated as 1 nanoWatt per Hz (1 Watt divided by 1 x 10^9). Over a 1 KHz bandwidth of another receiver the received even-spread UWB signal

would have a 1 KHz bandwidth signal total energy of 1 microWatt. But there are no values for path loss/gain yet.

Rather than using a 30 meter distance (about a 100 feet) to a neighbor's receiver capable of tuning in narrow bands (unlikely), let's postulate a 100 meter distance with the same Tx-Rx loss/gains modified for the shorter distance. Total path loss plus antenna gain is now -59.5 to -64.7 db. With a total transmit power of 1 W or +30 dbm, this second, narrowband receiver gets an input of -29.5 dbm at 1.2 GHz to -34.7 dbm at 2.2 GHz. However, the narrow filter in this second receiver will pass only one-millionth of the transmitted evenly-spread energy so the second receiver "looks at" only an equivalent energy of -89.5 dbm to -94.7 dbm.

Given the second receiver NF of 6 db and a 50 Ohm system at 75 F (296.9 K), its equivalent noise floor would be at -131.9 dbm. Is there sufficient signal to noise to clearly show the evenly-spread UWB signal at this second receiver? Yes...42.4 to 37.2 db to be more exact...provided that NF is as good as advertised. :-)

The presentation of this problem was hampered by a mixing of paradigms, of thinking too much that a UWB signal is "just like" a DSSS of a cell phone, appearing as even-spread random "noise" across a narrow spectrum. It has NOT BEEN DEFINED YET.

If the UWB signal were some mythical 0.1 micro-second pulse with width modulation, then the total energy will cluster at 10 MHz increments. That is enough to have a conventional 2m receiver be working from a down-converter and NEVER HEAR ANYTHING from the 0.1 microsecond UWB signal. Or, it could be sitting right on a cluster of energy and get more than expected.

What is even more complex is that the conventional comparison uses a repetitive signal analogue as to what to expect across a spectrum. That is a convenience and much, much easier than trying to find peaks by a time-amplitude analysis. In practice, even a DSSS signal does not have spectral content that persists as if it were repetitive...or as "noise-like" in an even distribution per frequency. Using a repetitive waveform transform is an absolute worst-case spectral energy analysis.

Cellular telephone digital patterns are generally chosen to spread energy evenly across a moderate

bandwidth. The standard is defined. The UWB is not yet defined. With 33 nanosecond pulses, a UWB could have clusters every 30 MHz apart, having "open spaces" wider than the present HF spectrum.

Now, if anyone is doubtful of all this, just get a good, calibrated spectrum analyzer with a high dynamic range and start measuring some wideband sources with both repetitive and non-repetitive modulation. Note: Use proper spectrum analyzer bandwidths and sweep speeds to catch all the little energy products. The results can be interesting...and don't always follow the narrowband analysis methods.

Money makes the world go-round. Methinks. And if you want to
get more young people in the hobby, I think you need the kind
of marketing muscle that Radio Shack can provide. And, I think the fraud
issue here is over-estimated. There's been fraud
in the testing system as it is. If you had big companies involved,
who had lawyers, they could snap the whip with the employees.
And, they'd be better positioned to enforce standards, than random
individuals. I think.

Just enact some fines for cheating. Hire a few people to go
around, and masquerade as applicants to keep the system clean. And,
open an office, that would handle reports of fraud, and then
investigate as a criminal matter. It'd probably be cleaner than
the current setup.

Indeed correct. I used the path loss at 1.2 GHz, the frequency I was trying to receive in this calculated scenario. I didn't feel that the path loss on the frequencies I was not trying to receive was important.

True enough, but the undefined UWB signal as being a uniform distribution of broadband noise makes the easiest calculations. Uniform distribution is not worst case.

Those figures are correct.

You are correct, an unmodulated UWB signal will either show nothing in the nearby narrow-band receiver, or it will show much more than the figures I calculated, but only on a single frequency. An UWB signal that is modulated with a slow data rate will result in slightly less signal across a slightly wider frequency range. An UWB signal that is modulated with high-speed data will appear to be fairly uniform across the frequency range.

One of the reasons I chose uniform distribution of noise for this approximate discussion,.

> Cellular telephone digital patterns are generally

None of the UWB proposals I have seen have stipulated an unmodulated pulse, nor have they stipulated limiting the modulation to slow speeds. Even so, analyzing the levels of those clusters would give an interference potential on those frequencies >> the one I caclulated with a uniform noise distribution approximation.

You will have to ask the FCC, although I don't know if they are required to keep transcripts of internal meetings. The NPRM they issued summarized their proposal and the Report and Order summarized their decision.

> My understanding is that there were folks that had concerns about the
elimination of the Novice
> Class license.

I don't know what records the Commission keeps on the meetings of its staff or its Commissioners.

> but I've got a hunch that there is some support for something that will
set up a more healthy
> learning/operating environment for kids.

If that support, assuming it exists at all, were strong enough that they would reconsider their restructuring decisions, I think that they would have restructured the Novice at the same time instead of eliminating it. I think it will be hard to convince the Commission to implement a replacement for a class of license that very few people were choosing to hold.

> Why would the FCC have recently created FRS, and now MURS, if that were
not the case?

I believe that the FCC created those services to be communications tools. On what basis do you determine that their purpose is tobe a learning environment for kids? Is this documented in their rules or in the Report and Order that created them?

The club radio station at Manchester High School (CT) had fallen into disuse in 1966, the year I first attended.

> >The 80 & 40m Novice bands crawled with other kids.

> Really? My experience was a lot of WW2 vets were doing
> the crawling.

The 80 meter band was loaded with CW signals starting just as the kids got home from school and lied about their homework. Of course, most receivers of the day had about 5 kHz bandwidth or so, resulting in multiple signals being heard in the passband simultaneously. Even so, the Novice bands were a lot more used than they are today. From memory, most of the hams I worked were under 30, with a pretty high percentage of kids under 18.

There were more "local" radio and electronics stores then than now. Mail order electronics has become the norm. Back then, to get a part I had to drive across town and hope it is stock. Today, I make a phone call and give them my credit-card number. :-)

>Perhaps you can ask Radio Shack whether they think your proposal is viable.

The enabling legislation clearly says that examinations are to
be given on a "reimbursement for out-of-pocket expenses" basis
which precludes making a profit. [47 USCA s. 303(f)(1)(I)]

> license to simply operate, and never improve himself technically?

For an individual ham? No harm at all. For all hams to choose to take that path? I don't think Amateur Radio would survive long. I think that the likelihood all of those who choose to be hams will simply operate and never improve themselves technically is about zero. I think the likelihood that some individual hams will do so is just about 1.0.

As I look at the present ratio, I believe it to be at a level where the percentage of hams that do improve themselves technically is high enough that we meet our regulatory goals as a service. Incremental changes in testing and requirements to try to trap those last few (that are, IMHO, causing no real harm) would be at a point of diminishing returns right from the get-go.

They were not agressive in 1963; they gave me my General, which got me all amateur priveleges, and I never heard another word from them.

> It was sticks & carrots galore and that's simply the way it was *then*, historical fact.

One carrot; take a simple test with a 4-page study guide and have fun until you get your General. The only stick is that you have one year to do it. If you don't want to play with sticks and carrots, go right for General and be done with it altogether. Not exactly "galore" IMHO.

In that case I would like to make you an honorary member of NHI and assign
you the next sequential number NHI#2741.

While our membership is growing by leaps and bounds, I would ask that all
prospective members no longer make their contributions in Pokemon Pongs, or
baseball cards. While we at NHI recognize the intrinsic value of your
contributions, I have been unable to trade them for necessary required
supplies at my local tavern.

I would suggest that you rethink that tact.

Did I miss out on the announcement where you had been appointed Usenet enforcer?

net protocol does not allow me to alter the headers on a thread I did not start. As I am not the author of this thread, you are addressing the wrong party.

I also note that your message was sent to all the newsgroups as well.

I can't imagine why the ham demograpics would be so different. It didn't seem to be a fluke but I never paid any attention to any of the "stats". There were also several hams in the preceeding class. Two of my high school ham classmates were also classmates in enginering school, one of those is a lifetime buddy and we've been in the same contest club for over 40 years. Maybe it had something to do with the heavy concentration of the electronics industry around here in that timeframe. RCA, Philco, GE, the big Navy electronics labs, even B&W. 1963 was ten years after my time as a Novice, that could be a factor. Beats me.

I'm sure it was. I bought a couple National right-angle drives
back in 1949, no doubt inspired by the thoughts of amateurs
desiring this particular model. For something else of course,
not to make a mechanical marvel such as the Bandmaster.

>It is also very compact.
>The matching VFO was designed with a slanted panel and a nice flat and

>Yes, indeed. See http://www.motron.com

Thank you for the interesting website, Ed.

The "TxPorter" works by measuring the transmit frequency drift
when activated. Sounds simple enough...but that assumes
that each transmitter's frequency does exhibit short-term
drift (probably does, no dispute). As to "identification" it depends
on comparing to a "known" database (software limit of 256
"fingerprints"). Not quite the same detail as with finger type
fingerprints but better than nothing. :-)

Motron sells theirs for the economical price of $799 for computer
card and software. [needs a computer existing] 800 bucks
doesn't sound "economical" to the average amateur or does it?
I suppose it does. If W1AW can afford commercial Harris HF
transmitters for an amateur radio station, it does, it does. :-)

>
>Give me a single reason we should be bending over and kissing some snot
>nosed kids ass to get him active in ham radio! If they are interested, I
>will bust my butt to help them.

There is no reason whatsoever. My experience has proven to me that
people who are genuinely interested in amateur radio will get involved
on their own initiative. What is needed, more than anything else, is
major, mass media publicity. Unfortunately, the ARRL seems totally
helpless in getting any for us.

>I have Elmered more than a few in my time, but at no point did I waste time
>on anyone who had no interest.

Nor should you have to. Whenever I've been involved in ham radio
instruction, I've always told the class right from the beginning that I am
there to show them the way, but there is a lot of hard work that needs
to be done and I'm not going to do it for them. That usually causes
about a 90-percent attrition rate right from the beginning, and I'm left
to effectively "elmer" the remaining few truly interested newcomers
who are more than willing to learn the code, open the books and
read them, and learn which end of the soldering iron gets hot.

>I had one guy wanted to be a ham and was having trouble with the code. It

Well, unless you're a trained educator, I wouldn't have bothered with
that guy. Ham radio isn't a proper hobby for illiterate people. My
advice to them would be to take care of learning basic life skills before
they concern themselves with hobbies.

>radio, and was given the impression that I "better" be a fairly fast learner,
>or I would receive a public lashing for what I felt was an innocent choice of
>words,

Ed:

Just exactly how "slow" a "learner" should we hams tolerate? When told, once, that use of terms like "handle" and "personal" are not generally accepted on the amateur radio airwaves, how many infractions must be permitted before the newcomer can be "set straight" in no uncertain terms (preferably off-the-air)? To use a different example, how many "yield" signs must be posted at one intersection to actually induce the behavior of making the motorist yield to oncoming traffic? Obviously, a reasonably fast learner will only need one; but you apparently seem to advocate an unlimited number of "yield" signs at each intersection, right?

I would very quickly decide that is not a caring, sharing community. I
>almost certainly would find a different circle, because with friends like
>that,
>I would not need enemies.

To which I would reply, "Be my guest -- don't let the door hit you in the ass on the way out!" But getting back to this "caring, sharing community" crap, Ed, just what *was* Mother Teresa's call sign?

>Fortunately, when I first became a ham and probably made "gaffs" that I
>wasn't
>even aware of, I didn't receive the type of "welcome" you are describing.

Neither did I, Ed, because I made relatively few "gaffs" (sic). You see, picking up a microphone and talking into it is no big deal. It's not rocket science, and it's not social science. It's just talking. And us hams have usually talked on radios pretty much the same way we talk all the rest of the time -- without wierd, unconventional slang, acronyms, and lingo. Of course, if you live in a run-down trailer park in 4-land, your mileage may vary.

>IMHO, telling people what they "better" do is not in the spirit of ham radio
>that I have respected for decades.

But telling them what they "better not" do certainly is!

Actually, no; my General expired. I think it was 1976 when I got relicensed. I set off to get my Extra at that point, but parked in a no-parking zone in Boston and got my car towed. I had to sprint to the FCC exam site and just missed the 20 wpm code test. I took all the tests through Advanced that day, then went on and took the First Phone. All carrot; no stick.

How much of that is due to differences in hams and how much is due to differences in the rigs? We learned troubleshooting because we felt we had a shot at fixing the rig. Although it is possible to do more troubleshooting on today's rigs than most hams will admit to, I can well understand if troubleshooting does not appear to be worth learning in today's radio environment.

It looks like I get to change back on my CW position and you will have to go along in agreement Ed,

The Board also revised its position on whether Morse code proficiency should continue to be an international requirement to license operation below 30 MHz. The Board approved a resolution that ''recognizes and accepts'' that the Morse requirement likely will be dropped from Article S25 of the international Radio Regulations at the 2003 World Radiocommunication Conference. But the Board held the line on retaining a domestic Morse requirement, saying that each country should be allowed to determine for itself whether it wants to have a Morse code requirement.

The Board's Morse Code resolution declared that deletion of the Article S25 international requirement at WRC-03 ''should not automatically or immediately mean a similar removal of the Morse code from Part 97 of the FCC rules.'' Morse code, the Board affirmed, deserves continued support as an important operating mode as well as in terms of spectrum and ''should be retained as a testing element in the US.'' The resolution also called on ARRL Headquarters staff to ''develop a program designed to promote the use of Morse.''

The resolution supersedes all previous Board policy statements regarding Morse code and Article S25.

What? You gave up on your new outlook so soon?

I was pleased to see the Board's policy wrt the international treaty on Morse code testing. In my input to my Director, I pointed out that, IMHO, international treaties should be reserved for things like global warming, president stabbing and intercontinental ballistic missles. I don't believe that the nations of the world need concern themselves internationally with Morse code testing in the Amateur Radio Service.

I also agree that it is quite appropriate that each nation be free to decide for itself what specific
Morse-code requirements are needed for an amateur license.

The ARRL Board took the step to reaffirm that it is not changing its current policy wrt the Morse-code tests for US amateur licenses. I didn't believe that it was necessary to say this; simply changing the existing policy wrt international requirements stood on its own. I support not changing the position wrt US testing at this time, but possibly not for the reasons that you do. It is quite likely that consideration of that at WRC will take place in 2003. It would be at least a year before that treaty is ratified, and until then, the FCC has given every indication that it will not be revisiting the Morse code testing issue.

At that time, we will have seen changes in the Amateur Radio Service, may have seen other changes in the nature of the testing and will have gone through at least one election cycle in each Division in the ARRL Board of Directors. Although I feel it safe to say that some of the present incumbents will serve on the ARRL Board in 2004 or later, I also feel it safe to say that it is likely that there will be a new mix of leadership and that Board could very well come to a different policy conclusion than this one. I do not believe it would be appropriate for this Board to make policy that may need to be determined by the ARRL Board in the future; in fact, would be more competently determined by the Board at that time than it is now. The Board addressed what is before Amateur Radio now, the need to prepare for the upcoming WRCs over the coming few years.

How the Board of 2004 will decide will be determined by the makeup of that Board, the influence of ARRL membership and the specifics of what is proposed by the FCC. If more of those who seek to end code testing in the US join the ARRL and vote the bums out, then we could see an entirely different

view. If those who feel that code testing needs to be preserved make their views known, then it is equally possible that the League could choose to pursue keeping code testing as part of the US requirements even if it is no longer an international treaty requirement.

Will I support the present policy of the ARRL Board? Yes, I will. There is no action that can be taken at this time by ARRL wrt code testing in the US, so not changing the policy at this time, but deferring it until possible action is less than 3 or more years away is, IMHO, the right thing to do. Yes, I support not making a decision now that can be better made later, when more factors can be considered.

I will add that these are my personal views. The ARRL policy on the matter is stated clearly in the resolution and Web article.

Well, if you have changed your mind, you may have to change your sig. I don't think it really promotes CW to call it "Lotsa' Hassle International," though. Do you? :-)

Well, Larry; the plan you proposed would have eliminated ARRL's RFI program, so even you deemed it not acceptable. Did you come up with an alternate? At >$100k per 30-second spot on prime time, I am not sure mass-media ads are the answer.

What percentage of people that might be interested in ham radio do you feel do not know about its existence?

In the classes I have helped teach here in Newington, we skip the lecture
and have a much higher graduation rate than 10%. Now, if ARRL is going to
spend all that money on mass-media ads for you, Larry, we expect you to
score better than a 10% on your "final exam."

It appears to me, Larry, that the guy's concern with ham radio helped him to attain a major basic life skill, with some help from Fred. That must say more to me about the value of ham radio than it does to you.

house in the middle of the old city, ya had to be outta yer mind to drive.
>

> I had to sprint to the FCC exam site and just
> missed the 20 wpm code test.

>
I blew the General code test the first time, had to wait a month to take it over
and wound up getting my General just a few days before my Novice died. You had
to start getting really concerned about not having taken the General test 10
weeks before the end of the Novice license 52 week term if you wanted to stay
on the air without a break. Assume you flunk the first pass, wait 30 days to
take it over, pass the second attempt, then wait six weeks for the FCC to
process it and mail it. Talk about different days . .
>

> I took all the tests through Advanced that
> day, then went on and took the First Phone. All carrot; no stick.

>
Yeah, well I went thru the stick & carrot thing twice. First with the Novice,
got the General and had it all. For 14 years I thought I had it made for life
and all of a sudden I wound up having to take the Extra or get whacked with the
stick.
>
I had to beaver on the code because I'd long since been copying only in my head
so I had to get back up to speed with the pencil & pencil drill. I pretty much
breezed thru the Extra. The examiner casually tossed another exam across his
desk at me, sed "Try this one too, Kelly". Wound up with a Second Telegraph.

Source record: 1737

From today's ARRL Bulletin:
>
"The Board also revised its position on whether Morse code proficiency should continue to be an international requirement to license operation below 30 MHz. The Board approved a resolution that ''recognizes and accepts'' that the Morse requirement likely will be dropped from Article S25 of the international Radio Regulations at the 2003 World Radiocommunication Conference. But the Board held the line on retaining a domestic Morse requirement, saying that each country should be allowed to determine for itself whether it wants to have a Morse code requirement.
>
The Board's Morse Code resolution declared that deletion of the Article S25 international requirement at WRC-03 ''should not automatically or immediately mean a similar removal of the Morse code from Part 97 of the FCC rules.'' Morse code, the Board affirmed, deserves continued support as an important operating mode as well as in terms of spectrum and ''should be retained as a testing element in the US.'' The resolution also called on ARRL Headquarters staff to ''develop a program designed to promote the use of Morse.''
>
The resolution supersedes all previous Board policy statements regarding Morse code and Article S25."

Marketing muscle? Is this from the same group of drooling no-loads I've encountered in almost every RadShack I've entered over the past several decades? These folks panic when a customer refuses to provide his name and address.

The people who are Radio Shack's customers seem to be from several distinct groups: a) those who need a part in a hurry and can't wait for delivery from a "1-800" house (I generally fall into this group), b) those who don't care about price, c) those who don't care about quality and d) those who are waiting for a spouse to finish shopping at the mall.

I don't think we need individuals who are incapable of identifying an electronic component administering amateur license testing.

The little southern West Virginia town of Oak Hill where I lived in the early and mid-1960s had a population of about 7,000. Collins High School boasted an amateur radio club (which I helped to begin as a sophomore) and the town had six teenaged Novices in the '63-'64 time frame. None of us are EEs but all are still active hams. K8CFT who ran the local TV sales and service shop and who administered our exams did a pretty good job of motivating us.

1493. The League's latest dues hike announcement

Newsgroup: rec.radio.amateur.policy
Date: 2001-01-23 02:53:05 UTC
From: Old_Timer <oldtimer@nonsuch.net>
Message-ID: <3A6CF211.2319703D@nonsuch.net>
Source record: 1743

Does the League's newly announced substantial dues hike in these times of low inflation strike anybody else as being excessive?

I noted Dave Sumner's talk of the ARRL being involved in the kinds of things which dues and publication sales would not cover. My feeling is that there is little that the League should be doing which could not be covered by dues and publication sales.

My own feeling is that $39 per year is high for value received since the League already charges now for services which were formerly provided at no cost to members. QST is almost void of good articles these days. There is a dearth of technical content. Contest covereage and DX news are minimal. If I wasn't already a life member I'd have think hard to come up with enough reasons to justify renewal.

Since he was a part of the inner circle for a while, perhaps Hans can share his views on the announced increase in ARRL dues.

Ed, serious for once, Most TV stations are required to air Public service announcements. A message about ham radio, directed towards today's youth would qualify and be no cost except for production.

Tie it in with the Big Brothers / Sisters mentoring program.

I would be glad to do a bit of research as to what is involved with the PSA's if any interest at Hdq.

Let me know.

For what ever reason this cross posting continues to be a problem usually stemming from the ham groups. You surely have control to which NG you direct your response to. It figures you would follow everyone off the cliff to adhere to protocol. Do you believe that anyone who is only interested in CB gives a rats @$$ about some new Brownie license to use a radio? This NG is CB no license, no policy etc. So why even post it here?

If I have to nominate myself as the enforcer of this group so be it others will support the cause. If the amateur NG would like all of the CB posts crossed to their NG it can begin immediately. You see it is like one guy turns on an amp then another then another and pretty soon the whole band is unusable. Is it time to see who's is bigger? Or can this just end and everyone take their posts where they belong?

Since I don't know the origins and really don't care to waste time researching I am posting back to all the groups so that no one can later say what happened and why. This thread being crossed to the CB group can be stopped if you want to. Or you can get prepared to read many more posts that don't pertain to your groups.

1497. Re: ARRL code test resolution

Newsgroup: rec.radio.amateur.policy
Date: 2001-01-23 04:23:22 UTC
From: Larry Klose <lklose@net-link.net>
Message-ID: <3a6d0749$0$30009$44a10c7e@news.net-link.net>
Source record: 1747

Here the ARRL Board's Jan 20 resolution:

On motion of International Affairs Vice President Stafford, seconded by Mr. Frenaye, it was MOVED that the following resolution be adopted:

WHEREAS, Morse code, named after Samuel Finley Breese Morse, is an invention that has been essential to telecommunications for over 150 years; and

WHEREAS, the international Morse code has been an essential mode to Amateur Radio from its beginning to this day; and

WHEREAS, Radio Amateurs formed a pool of skilled Morse operators vital in the 20th Century for national defense, disaster, maritime-mobile and aeronautical-mobile communications; and

WHEREAS, since the 1950s there has been a great influx of other technologies that have gradually reduced the need for trained Morse operators outside the Amateur services; and

WHEREAS, the aeronautical-mobile and maritime-mobile applications of Morse have been or are being terminated throughout the world; and

WHEREAS, there is an agenda item for the 2003 World Radiocommunication Conference to consider Article S25; and

WHEREAS, it is highly likely that administrations will delete the Morse code requirement in Article S25 at WRC2003; and

WHEREAS, the international Amateur community has followed the United States lead in reducing the code speed requirement for licensing to operate on bands below 30 MHz to 5 words per minute and there is a trend toward elimination of this requirement; and

NOW THEREFORE BE IT RESOLVED, that the ARRL Board of Directors recognizes and accepts that suppression of the Morse code requirement in Article S25 is likely to occur at WRC 2003; and be it

FURTHER RESOLVED, that deletion of the requirement from Article S25 should not automatically or immediately mean a similar removal of the Morse code from Part 97 of the FCC rules; and be it

FURTHER RESOLVED, that each administration should determine if Morse code is retained as a testing element; and be it

FURTHER RESOLVED, it is the opinion of this Board at this time that Morse code should be retained as a testing element in the U.S.; and be it

FURTHER RESOLVED, that the Morse code is deserving of continued support as an important operating mode including providing for the protection and

maintenance of sufficient spectrum in band planning; and be it

FURTHER RESOLVED, that staff develop a program designed to promote the use of Morse code; and be it

FURTHER RESOLVED, that this resolution supercedes all previous statements of policy related to suppression of the Morse code requirement in Article S25.

Likely a ham club would be more likely than the average amateur to buy and use that type of equipment to track down violators on their repeater systems. To a club of any size that would not be hard to finance...

I agree. But the percentage of non-technical hams as compared to the
total ham population is vastly higher today than it was in the 50's
and 60's, don't you agree? Do you think this downward curve of
technical hams will ever turn upwards again? If not the curve will
eventually approach zero...

I think that most of it is due to the rigs. They were simpler and much
much easier to work on years ago. The cars were simpler then too. I
could tear a car engine down when I was a teenager. The boys who
married my daughters have trouble changing their oil. :-) I think
the same principle applies to ham rigs...

>Although it is possible to do more troubleshooting on today's rigs

>ball
>game so long as the rulemakers are in accord with our collective wishes.

Interesting philosophy there. Except...who are the "we" in
"we the people?"

I can understand that the "we" includes only already-licensed
radio amateurs since so many have declared their "collective
wishes" in regard to such a rigid maintenance of the status quo.
Still others express "collective wishes" as if the entire "amateur
community" were a form of lodge hall or fraternity (or even
sorority) and insist on obtaining a license _first_ before being
able to voice anything in regards to license testing matters.

The FCC is the only US civil radio agency that regulates US
civil radio and the only group that issues amateur radio
licenses to civilians. The FCC has stated more than once,
including in their Handbook, that they exist for and will hear
from all US citizens. On and about any US civil radio
service.

I sense an interesting dichotomy in this newsgroup. It is
almost exclusively a forum for already-licensed radio
amateurs with many of those having a very rigid rule of
conduct not only on obeying the law of regulations but
also of strict obediance to obeying a non-law of traditional
conformity to everything in and about the "amateur
community." The other side of this dichotomous state
is repeated attempts to dissuade, bar, and generally
disfavor any non-amateur from expressing any thought
on the subject of or regulations regarding amateurs.
That other side is quite contrary to the US Consititution
in its Preamble which begins "We, the People..."

There is no "political correctness" nor any "sensitivity to any weak" individuals or anything else to this other side of the dichotomy. It is simply against the principles of the Constitution. It smacks of a fraternal order which wishes to go against the US Constitution, not quite illegal but as close as one can get to it without having codification in law.

It would seem that this "other side" attitude is a good bar against other US citizens desires, of any kind, in getting or even attempting to get into US amateur radio. That attitude is not good for much of a future or even help from the single US civil radio regulation agency.

It is as if there were a separate "declaration of independence" that is "signed" by all on completing a US amateur radio test as if they are distinct from and independent of the US Constitution and any democratic principles.

Just an observation from someone who believes in and once took a serious oath to defend the United States Constitution with his life if needs be.

There's a truism there. Given the inherent reliability of today's
semiconductor and passive components, failure rates are
very low compared to vacuum tube days.

Troubleshooting _inside_ a box isn't needed by today's amateur
radio operators. But, they should be able to troubleshoot
things _outside_ the boxes. Hopefully, some will learn to
measure the performance of their ready-builts to stay within
regulations' technical requirements.

Absolutely not.

The "requirement" for PSAs (it never was a REAL requirement,
just an FCC program-type category that had to be reported to
earn "brownie points" at renewal time) went out when Program
Logs and Composite Week reporting were abolished in the 1980s.

The stations that still keep doing it do it to foster good
will in the community, not because it is required.

Well, I sure can. I didn't buy one of those cheap Life memberships way back when because I wasn't that sure I'd always want to be a member, based on some pretty lamebrained acts they either did or condoned. Now my membership expires in April and they keep trying to help me make up my mind whether or not I want another year.

One more mark on the negative side.

There's nothing that comes in QST that I can't find on the net. They have no visible clout with the FCC anymore. Nothing much but feel-good propaganda issues from Newington these days.

What good are they?

Hey-- I see that the BOD made Mark Wilson, the Editor of QST, the "Cheif Operating Officer", over most HQ operations. I thought that was the Executive Secretary's job. ???????????

> Too bad you can't quit... :-)

Percentage-wise, it IS high. If you look at what inflation has been since 1997 when the League last upped the cost of yearly dues, it is outrageous. I think most folks would gripe about five bucks out of their pockets when they get nothing additional for the fiver. If it is such a small amount, why doesn't the League cut the present dues by five bucks per year. After all, it is only five dollars--a mere 2 cents per day ;)

I could quit but I'm paid up for life and I'm not finished living yet. Besides, you know the old saw: I can do more to change the ARRL from within than from the outside.

For one thing, I can air my gripes here.

For Pete's sake, Len. You've been babbling here for years and many might like to dissuade you, it hasn't yet worked. No one can bar you from expressing your opinions even if we don't share them or like them. I, for one, reserve the right to call you a fat head if I disagree with your views. That's the other side of free speech. Being able to tell you that I think you bring little to the table is MY right.

> There is no "political correctness" nor any "sensitivity
> to any weak" individuals or anything else to this other
> side of the dichotomy. It is simply against the principles
> of the Constitution. It smacks of a fraternal order which
> wishes to go against the US Constitution, not quite
> illegal but as close as one can get to it without having
> codification in law.

Where is it mandated that I must be any more "politically correct" in putting forth my disagreement with something you might have written? Political correctness is another way of dancing around what one really means. Folks are worried today about damaging the self esteem of another. I'm not worried about your self esteem, Len. I would be most interested in hearing you explain how the amateur radio service is doing anything close to illegality or against the principles espoused in the U.S. Constitution in disageeing with the views of Leonard Anderson.

> It would seem that this "other side" attitude is a good

There always has to be a comedian in every group. :-)

There is a guy around here who says "QSL" all the time. Its not that
he can't hear, he's just too drunk to understand what anyone is saying.

According the APCO (Associated Police Communications Officers) manual for 1945 (which I have before me) the Los Angles PD at that time had a radiotelegraph station that operated on the frequencies of 5135, 5140, 7808 and 7935 kc, operating under the callsign KGPL.
I find no mention of radiotelegraph capability at CHP Sacremento in the 1945 manual. BUT- evidently considerable change took place by 1951, as shown in the '51 issue of the APCO manual, which I also have. It shows PD Los Angeles active on channels 'A' through 'I', with the callsign KMA89.
Channel A was 2804 kc, B = 2808, C=2812, D = 5195, E = 5135, F = 5140, G = 7935, H = 7805, and I = 7480 kcs.
The 1951 APCO Handbook edition also shows CHP Sacremento with the exact same capability, under the callsign KMA25. Both stations were licensed for interzone (outstate) traffic handling, and were the only California stations so licensed.
I know that at some later time the interstate traffic contact point was assigned to CHP SACTO, no doubt by agreement beteen the agencies. But, contrary to the belief held so dearly by Mr. L.H. Anderson, Los Angeles PD did indeed use a radiotelegraph station to handle important traffic pertaining to the police business well into the second half of the twentyth century. And you were right - SACTO was the CW node for California, solely later in the era.
As was the case in some heavier populated states, California had a in-state teletype system that distributed the outstate traffic recieved by CHP SACTO. Any traffic routed out of state also had to be teletyped back to SACTO who then placed it onto the CW net for out of state routing. I'm sure the volume of in-state traffic handled justified the statewide tty system.

In contrast my state used CW at each of the nine district stations, each of which could communicate direct to other states, even to SACTO, usually via the relay station at Flagstaff, AZ. The CW net was replaced by TTY in Missouri in 1964, and the CW gear ate the station where I

worked was uninstalled in late 1965/early 66. Flagstaff remained in operation until around 1972, according to a ham who was a former operator there. See:

http://www.metronet.com/~nmcewen/police_radio.html

As an old street cop that may be of interest to you if you haven't already read it.
And the MHP HQ station relayed CW interstate traffic for other states until about that time. I was later a part of the technical crew that removed all the CW gear from the state HQ station in 1975. By '69 we in Mo. had a computer terminal at the operating console.(It was an early RCA, but it worked quite well).

Another contrast. Visiting in Fresno in 1980, I noticed a CHP District Office nearby and decided to pay the radio staff a visit, and look over the operation.
What I found made me glad I lived and worked in the Midwest.
Discussing operations and conditions with the non-uniformed personel (I was uniformed), I learned that my salary was at least 50% higher than theirs, they were not career personnel, (one was a retired bomber pilot, another a sheriff deputy's wife, etc). I asked what level of FCC license they were required to hold (we all held either first or second phone) and they asked "What's that?" When I asked them how they made an NCIC check, they pointed to an ancient TTY terminal over in the corner of the room - they had to send a TTY message to SACTO, where it was entered into the computer system, and the answer returned in the reverse, time consuming fashion. At home I had the keyboard and screen in front of me and got very quick responses.

I came away disappointed.

I agree with that but the other side of it is the explosion of the parts count, you know how that goes. I have a somewhat elderly Icom 2m FM mobile xcvr, the two incandescent dial lamps burned out. With the help of a thread I launched in .equipment which drew a half dozen posts I tracked down the lamps and was told I should expect to be a soddering arn micro-neurosurgeon for an hour if I try to replace the lamps myself. Two lousy little panel lamps. Screw it, I'm using a flashlight. Ask me if I'm ever gonna dive into my ten-gazzilion junction HF xcvrs.

>Just exactly how "slow" a "learner" should we hams tolerate?

I don't know. What time limit does Part 97 place on learning?

> When told, once, that use of terms like "handle" and "personal" are not
>generally accepted on the amateur radio airwaves, how many
>infractions must be permitted before the newcomer can be "set
>straight" in no uncertain terms (preferably off-the-air)?

What does Part 97 have to say about such "infractions?" What does the US constitution have to say about such infractions? I think that 99% of those who use the "wrong" lingo on the ham bands will come around on their own; I feel no need to "set them straight."

> To use a different example, how many "yield" signs must be posted at one
>intersection to actually induce the behavior of making the motorist
>yield to oncoming traffic?

Yield signs are a matter of law. What is the law about the use of the word "personal" instead of "name?"

> Obviously, a reasonably fast learner will
only need one; but you apparently
> seem to advocate an unlimited number of "yield" signs at each intersection,
right?

I advocate that the number of yield signs can be determined by law. You advocate that the choice of words people use should be determined by your personal tastes in what you want to hear. Which one of us is on higher moral ground, Larry. Do you think I should be be able to "set straight" those who excerise their right wrt other parts of our Constitution? Why do you think that the right to bear arms is sacred yet the right of free speech is sacred, as long as you don't hear a word you don't like in a particular context?

>To which I would reply, "Be my guest -- don't let the door hit you in
>the ass on the way out!" But getting back to this "caring, sharing
>community" crap, Ed, just what *was* Mother Teresa's call sign?

Hmmm, is that sorta' like "politically correct?" I guess I have a bit more faith in hamdom that you, do, Larry. I hope you are not surprised that you have only a handful of loyal followers...

>Neither did I, Ed, because I made relatively few "gaffs" (sic).

I don't have the details on the budget proposal, other than the Lab budget. But I do know that the decision has been reached over the past year to add more staff. The ones that I feel are most valuable are being added to address what I have seen as problems that the ARRL needed to address.

One staffer added late last year is someone to work on developing "in-house" news. I have seen again and again where someone at ARRL HQ has done something valuable and important for amateur radio, and not told anyone other than his boss. That "someone" has all too often been me.

Just as an example from my own work, I think that ARRL has been negligent in not telling its members that the ARRL RFI Task Group met in Allentown, PA and made a recommendation that ARRL staff investigate illegal Part 15 devices that operate in our ham bands and to select some cases to take to the FCC. (One of several action items.) I actually wrote up part of that meeting, but got on to other things.

Those other things included the tests that I did with some representatives from HomePlug on the home-networking products they are developing to use residential electrical wiring in homes to network computers. Ditto on similar work with the Home Phone Networking Alliance and the VDSL standards committees. I have this partially written up, too, but just can't find the time to put it all together.
That in-house reporter is starting to do just that, filling in the gaps in what I am able to and can find the time to do. IMHO, ARRL members have a right to know these things and I feel that ARRL has not communicated with its members as well as it should. That staffer is one way to address it. Right thing to do, or should I do a few less things and take more time to tell folks about them, or keep the lines of communcation closed? I think the League has been negligent in not reporting these things and I hope to see improvements.

The Education and Certification program was added last year, as well. With all of the real and perceived inadequacies of the testing process, it is important that hams have as many ways to learn as possible. ARRL already publishes a lot of good books, but those who are going to learn on their own from books are already doing so. A more formal approach was wanted by some, and some documentation of the demonstrated abilities of hams will be an added plus.

The ARRL Web page has been increased by quite a scope over the past years. Do hams use it? Should the League stop adding to the Tech info pages? I could let

the Tech Info Coordinator go to help pay for the staff I am adding to help with the growing problem of RFI to hams. Who wants to make the choice?

These are just a few examples; I can't supply all the details for things outside the Lab, but wanted to offer a snapshot of some of the reasons that more funding is being sought. I do recall that for this year, the budget is not balanced. There is some investment in the future; the future of doing more things for the overall benefit of ham radio (RFI, education) and some investment in staff that will help develop other sources of revenue that will help the ARRL do more without having to tap into the membership with dues increases.

What I don't think is fair to ARRL members is that much of this increase is to fund things that are not individual membership benefits but are for the overall good of Amateur Radio. They are being done for all hams, but are being paid for by those who are willing to pony up dues dollars every year. I hope that the realization that supporting things like the RFI program and education and Jim Haynie's Big Project and other things IS important will bring in those who are now standing on the outside.

I pay over $100 a year to belong to the IEEE. I pay over $30 a year for some of my non-ham magazine subscriptions. I will gladly pay this dues increase as well, as long as the League comes through on its promises to do those things it is setting out to do. And tells me about them. Even working at HQ, I find out things long after the fact sometimes. :-)

Actually, I just realized, I have put off the devil a bit on the dues increase. I just renewed my membership for 3 years, at the current rate (plus a multi-year discount). The dues increase is going to go in effect in July, so if you renew before then, you can get in at today's rate. Maybe by the time you have to pay the higher rate, you will decide it is worth it. :-)

Huh? The new rate represents a per-annum increase of about 3%.

> I think most folks would gripe about five bucks out of
> their pockets when they get nothing additional for the fiver.

For the past few years ARRL has been increasing some direct services to members and dramatically increasing expenditures in advocacy areas, as threats to amateur spectrum rise. During that time there has been no dues increase. Now one is needed in order to maintain and increase those activities. In other words, the dues increase is in part to help offset the costs of benefits -- direct and indirect -- that have already been added, and in part to help fund future increased activity. (Such as a new Lab employee to help Ed Hare with EMI/RFI matters.)

The statement that "they get nothing additional" simply overlooks the additions that have already been made and those that are planned.

Thanks for the 5H3US QSL that recently arrived.

My views on the increase? Cheap at twice the price.

I am constantly amazed at the amount of work that my membership dues accomplish for amateur radio. Many of the programs of ARRL benefit all amateurs, not just members, so I accept the fact that my dues help fund things beyond the benefits which accrue to me individually. Sort of like if AAA Members (rather than all vehicle owners) funded highway maintenance in my state.

Isn't the statement really saying that the ARRL is not seeking to change the US regulations at this time? It will be at least 4 years away before the FCC would even consider a change, looking at the timing of the WRC and estimating the amount of time it will take to ratify the treaty. I think that it is premature to set a policy now on a matter that cannot be changed now and that can be decided better when something specific can be put on the plate. A lot can change in the membership, in Amateur Radio and in the makeup of the Board in the intervening 4 years. It is, IMHO, up to a future Board to change or affirm its policy wrt US regulations when it appears that it is time to act. The present policy simply does not change the status quo wrt the ARRL policy on US requirements. Considering that no change in policy can effect any change in US regulations, I think the Board made a reasonable choice.

The Board dealt with the international treaty now because now is when the decisions need to be made.

IMHO, of course.

Hmmm . . mixed reaction here to that one. I've been involved with much bigger and scattered industrial operations which have in-house infranet webs which do a pretty good job of keeping everybody up to speed, departments & individuals have web pages, etc. Of course you wind up with at least one IS person and they don't come for free.

Feelings=perceptions and in this case perceptions of the ARRL most
certainly count. If the League desperately needs the money to do
something which appeals to the membership, a better selling job needs to
be done.
>

On air reports might be stale. Photos and personalities don't get
stale. News of upcoming operations would be interesting. So would

writeups of operations just completed (along with even more photos).

> I get the ARRL DX bulletin every week. Beats the hell outta the Yellow

I got mine when it was at (I think) $275 (1977?). Wisely invested, that
money along with the money received from others who invested long term
in the ARRL should have produced a good return.

Never much thought about it before but that could very well have had a lot to do with it. The father of one of the two kids I was closest to was an EE manger with Philco and had been ham when he was a kid, the other's father was a Navy lab type who had a ham ticket. Dunno abt the rest. The neighborhood ham club membership was at least 3/4 Navy lab employees.

Ed,

Be assured that I shall. I hope that he will be more receptive to
views of membership than former Director Kanode.

> hams these days...

Exactly. Any "ordinary" ham who attempts to dig into his TS2000 which has anything more than a operational glitch that might be corrected by resetting the microprocessor, or some other minor correction, is asking for more trouble than he really wants. And the problem here is not just that hams don't commonly possess technical knowledge and skill, many do. Even electrical engineeers know that there is much more to it than technical knowledge. Skilled technicians are sent to intensive school training on specific pieces of radio equipment for thorough familarization with those specific units. Been there, done that. You need specific knowledge, specific skills and specific test equipment with the attendant experience on how to apply them all.

I would very carefully limit my incursions into my Icom 756 should it fail. I haven't been through a specific course in that transciever. That doesn't mean I wouldn't do some serious investigating to see whether or not I might be able to learn enough to fix it myself. I bought the service manual for that purpose, as I always do. I even disposed of a perfectly good IC761 because I couldn't get a service manual for it, Icom America told me it wasn't available. But there is definitely a point beyond which I would not go, and away to the factory service center it goes.

I hope some of that money finds its way into funding for remedial math
skills for you, Jon. $3.40 would be a hike of 10%. 3% would be $1.02.
Now how much would a five dollar hike be?

During the past few years the League has also begun charging for
services formerly included at no extra cost to membership. The price

for other services has risen dramatically.

If I have a business and find myself with fewer customers (members) and less business I don't suddenly begin an expansion program; I find ways to cut costs--maybe even terminate some employees. It is not likely that I suddenly increase the price of my products by 17 or 18 percent. The business which took such a tack would likely find itself with even fewer customers (members).

Glad you received it. I've been back for six months and WA8JOC is STILL
cranking out the cards. He just received direct requests for QSLs from
my J52US and 9L1US days going back to the late eighties/early nineties.
I'm still at work on the antenna farm here and am hoping that everything
will be complete some time in the spring.

I think the League should do a better job of informing the membership as
to what it is doing and what the costs are.

> Sort of
> like if AAA Members (rather than all vehicle owners) funded highway

I'd love to see your roads. Here, the state collects the taxes and
pretty much ignores the road maintenance.

Randy, did you post this just to read your own stuff, or do you
really believe it?

I do agree in part that CB and FRS are consumer oriented services,
however the NG "alt.radio.family" and the stroies realted by "QRM" and
yourself only validate my assertion that these services are just as
much a "hobby" and Amateur Radio.

Of the shelf or not, you CANNOT convince me that the bandedge-to-
bandedge noise on 11 meters is just people using a radio as a tool for
thier business. Just taint so.

And I DO monitor FRS, especially in the ATL area, and I can tell
you that there are a LOT of people using FRS for the sake of fun with a
radio...NOT just to facilitate some other activity.

Per-annum, Dave. You know, the same basis on which inflation is usually
stated.

What has been the *total* (not annual) inflation rate since 1997?

Not that adjusting for inflation is the sole factor involved. As one
example, QST postage has risen twice since 1997, for a total of
something like a 20% increase. (Don't quote me on that number since I'm
working from memory, but it's in that ballpark.) That isn't reflected in
the CPI.

Direct fees for some services have been added or increased, but that's
not true of others, particularly those that aren't delivered on an
individual basis. The net result has been an increase in costs that
aren't recovered by fees.

> If I have a business and find myself with fewer customers (members) and
> less business I don't suddenly begin an expansion program; I find ways
> to cut costs--maybe even terminate some employees.

Thereby reducing service to your customers, driving customers away and
possibly entering the classic death spiral of an ever-diminishing
customer base.

> It is not likely
> that I suddenly increase the price of my products by 17 or 18 percent.
> The business which took such a tack would likely find itself with even
> fewer customers (members).

I'm sure some members will find $39 too high. I'm sure others will evaluate what ARRL is doing for them and decide it's worth $39. There's no point in arguing the ratio here since we'll know soon enough.

While I am disappointed that the Board so vehemently defended Morse
testing in the US in their resolution, I understand their reluctance to
deal with what is basically a non-issue at this time. First things
first, we will hold the League's feet to the fire to -enthusiastically-
support and foster support in Region 2, for elimination of S25.5 at
WRC2003. Then, in 2004, we will have another go-round on the US testing
issue. By then, the opposition of many of the Board hard-liner PCTA's
may be a dead issue, literally.

I will say this - the existance of the ARRL web page will play a large
part
in my decision on whether or not I want to remain a member. That is
probably the most useful tangible thing that ARRL has done, outside of
your ongoing efforts in RFI/EMI, in recent years. I do get a lot of use
out of it.
Its expansion should definitely be encouraged.

I hope so. I just wrote a short E-mail to George Race (Great Lakes Division
Director) asking that the ARRL board reexamine the issue of
retaining/dropping Morse Code testing when it is finally dropped from the
ITU treaty requirements.

Don't worry about it, Larry, this is just their "interim" position,
which they have adopted as they move from complete support of CW testing
to its complete abandonment. Can't make any sudden, sensational and
upsetting moves, you know. Might upset someone. Walk that tightrope.
Actually, I don't see where it matters more than trivially anyway,
since FCC today pretty well ignores ARRL.
Hang around long enough, you'll find out how it works.

You were talking to dispatchers who, except for very small
departments, are non-sworn personnel in California.

All technical work (system design, installation, and
maintenance) is done by techs of the State Department of
General Services' Communications Division, who, in spite of
"license deregulation", are required to hold FCC GROLs because
their duties also include servicing and adjustment of marine
and aviation stations licensed to the State.

IIRC Fresno was one of the "tail end" offices in the conversion
that was taking place at the time. It's all high-speed computer
now, with MDTs in the patrol cars.

> I came away disappointed.

I, too, was disappointed when I visited the Sacramento office in
1963, but I later found out that although this was where the
CW station was, it wasn't the HQ comm office, but the local
patrol office. The HQ comm office with all the terminals and
statewide remote-access panels was two blocks away in the big
HQ building.

I'm glad you did that, and I'm glad he did that. That's a good
resolution. I wish it hadn't happened in the first place, but this will
work out. Thanks for not giving up on it.

'Tis not my calculator that is broke, $5 is 14.7& of the %34 *annual*
membership fee.
Looks like an attempt to invoke New Math as yet another Newington Smoke
Screen. Doesn't work any better than it ever did.

This is one of the reasons I don't hang around rrap much any more -- too
many people like Dick who (willfully? ignorantly?) misinterpret simple,
direct statements and then use their misinterpretation as "evidence" of
unethical behavior on the part of the other party. Guess my stomach for
idiocy like this isn't as strong as Ed's.

Dick

>Now how much would a five dollar hike be?

Looks like about 3.5% per year to me, except we paid no increase in
the intervening years, so we saved $7.31 over a yearly 3.5% increase,
plus we can still save even more if we renew (for 1, 2, or 3 years)
prior to July.

1997 - 34.00 Baseline
1998 - 35.19
1999 - 36.42
2000 - 37.70
2001 - 39.01

I think the "at this time" language in your post and in the resolution is pretty important. IMHO, the Board is saying that it will leave it to the correct time to deal with the issue. I believe that to be the correct choice, for a number of reasons.

The only reasons to have dealt with it now would be if the US regulations were on the plate now -- they are not -- of if the ARRL Board had made up its mind now about how it wants the ARRL to handle a not-completely-defined issue that will probably come up four, or more, years from now.

> First things first, we will hold the League's feet to the fire
to -enthusiastically-

There is a wide range of ARRL response and position to the policy set forth at this Board meeting. It could indeed range from "enthusiastic" to simply no longer being the only dissenting vote at an international IARU meeting. Constructively holding ARRL's feet to the fire, in either direction, will indeed influence the implementation of ARRL policy.

> Then, in 2004, we will have another go-round on the US testing issue. By
then, the opposition
> of many of the Board hard-liner PCTA's may be a dead issue, literally.

I hope not. I would rather see an evolution of ideas and constructive change than see people die to give me my way. My views have changed over the years, as I imagine yours have; I would imagine that at one point in your life you believed that Morse code testing was important to Amateur Radio. I hope that as more hams are able to assess the impact of the changes have taken place to date that we may see more changes in the way people feel. We all have a few years to give our "final answer."

I wasn't trying to sign Dick's name... the rest of my posting got cut off. (I don't compose messages under Netscape for Linux often enough to be comfortable with its perverse key mapping.)

Mea culpa -- by "in house" news, I meant more information about the activities of ARRL being shared with our membership, through the Letter, Web, QST, etc.
